### Abstract

Installation and configuration reference for the connectors that are supported with ForgeRock® Identity Management software. This reference includes installation and configuration instructions for each connector, and examples that demonstrate how to use the connectors in a deployment.

# **Preface**

ForgeRock Identity Platform™ serves as the basis for our simple and comprehensive Identity and Access Management solution. We help our customers deepen their relationships with their customers, and improve the productivity and connectivity of their employees and partners. For more information about ForgeRock and about the platform, see https://www.forgerock.com.

### 1. About This Guide

This guide describes the OpenICF connectors that are supported in a deployment of ForgeRock Identity Management. The guide focuses on getting the connectors installed and configured with ForgeRock Identity Management software.

This guide does not describe all OpenICF connectors. Additional connectors are available from ForgeRock's BackStage site.

This guide is written for anyone using supported OpenICF connectors with ForgeRock Identity Management software.

You do not need to have a complete understanding of ForgeRock Identity Management to learn something from this guide, although a background in identity management and maintaining web application software can help. You do need some background in managing services on your operating systems and in your application servers. You can nevertheless get started with this guide, and learn more as you go along.

# 2. Formatting Conventions

Most examples in the documentation are created in GNU/Linux or Mac OS X operating environments. If distinctions are necessary between operating environments, examples are labeled with the operating environment name in parentheses. To avoid repetition file system directory names are often given only in UNIX format as in <a href="mailto://path/to/server">/path/to/server</a>, even if the text applies to <a href="mailto://path/to/server">C:\path\to\server</a> as well.

Absolute path names usually begin with the placeholder /path/to/. This path might translate to /opt/, C:\Program Files\, or somewhere else on your system.

Command-line, terminal sessions are formatted as follows:

\$ echo \$JAVA\_HOME
/path/to/jdk

Command output is sometimes formatted for narrower, more readable output even though formatting parameters are not shown in the command.

Program listings are formatted as follows:

```
class Test {
    public static void main(String [] args) {
        System.out.println("This is a program listing.");
    }
}
```

# 3. Accessing Documentation Online

ForgeRock publishes comprehensive documentation online:

 The ForgeRock Knowledge Base offers a large and increasing number of up-to-date, practical articles that help you deploy and manage ForgeRock software.

While many articles are visible to community members, ForgeRock customers have access to much more, including advanced information for customers using ForgeRock software in a mission-critical capacity.

• ForgeRock product documentation, such as this document, aims to be technically accurate and complete with respect to the software documented. It is visible to everyone and covers all product features and examples of how to use them.

# 4. Using the ForgeRock.org Site

The ForgeRock.org site has links to source code for ForgeRock open source software, as well as links to the ForgeRock forums and technical blogs.

If you are a *ForgeRock customer*, raise a support ticket instead of using the forums. ForgeRock support professionals will get in touch to help you.

# Chapter 1 Connector Overview

This chapter provides a high-level overview of the supported connectors.

For instructions on building connector configurations interactively, see "Configuring Connectors" in the *Integrator's Guide*.

# 1.1. Connectors Supported With IDM 5.5.1.3

### **Generic LDAP Connector**

The generic LDAP connector is based on JNDI, and can be used to connect to any LDAPv3-compliant directory server, such as ForgeRock Directory Services (DS), Active Directory, SunDS, Oracle Directory Server Enterprise Edition, IBM Security Directory Server, and OpenLDAP.

For information about installing and configuring the LDAP connector, see "Generic LDAP Connector".

### **CSV File Connector**

The CSV file connector is useful when importing users, either for initial provisioning or for ongoing updates. When used continuously in production, a CSV file serves as a change log, often containing only user records that have changed.

For information about installing and configuring the CSV file connector, see "CSV File Connector".

### **Database Table Connector**

The Database Table connector enables provisioning to a single table in a JDBC database.

For information about installing and configuring the Database Table connector, see "Database Table Connector".

### **PowerShell Connector**

The scripted PowerShell Connector toolkit allows you to create a connector customized to communicate with Microsoft systems such as Azure AD and Active Directory.

For information about installing and configuring the PowerShell connector, see "PowerShell Connector Toolkit".

### **Groovy Connector**

The scripted Groovy Connector toolkit enables you to run a Groovy script for any OpenICF operation, such as search, update, create, and others, on any external resource.

For information about installing and configuring the Groovy connector, see "*Groovy Connector Toolkit*".

### SAP Connector

The SAP connector is an implementation of the Scripted Groovy Connector Toolkit that connects to any SAP system using the SAP JCo Java libraries.

For information about installing and configuring the SAP connector, see "SAP Connector".

### **Google Apps Connector**

The Google Apps connector enables you to interact with Google's web applications.

For information about installing and configuring the Google Apps connector, see "Google Apps Connector".

### **Kerberos Connector**

The Kerberos connector is an implementation of the SSH connector, and is based on Java Secure Channel (JSch) and the Java implementation of the Expect library (Expect4j). This connector enables you to manage Kerberos user principals from IDM.

For information about installing and configuring the Kerberos connector, see "Kerberos Connector".

### **Salesforce Connector**

The Salesforce connector enables provisioning, reconciliation, and synchronization between Salesforce and the IDM repository.

For information about installing and configuring the Salesforce connector, see "Salesforce Connector".

### **Marketo Connector**

The Marketo connector enables synchronization between IDM managed users and a Marketo Lead Database.

For information about installing and configuring the Marketo connector, see "Marketo Connector".

### **Active Directory Connector**

The Active Directory connector is a legacy connector, written in C# for the .NET platform.

For information about installing and configuring the Active Directory connector, see "Active Directory Connector".

### **Office 365 Connector**

The Office 365 connector uses the O365 Graph API to manage Azure AD users and groups. This connector uses the OData 3.0 specification and can be used, with minor modifications, to connect to any OData 3 provider.

For information about installing and configuring the Office 365 connector, see "Office 365 Connector".

### **SCIM Connector**

The SCIM connector is based on the Simple Cloud Identity Management (SCIM) protocol and enables you to manage user and group accounts on any SCIM-compliant resource provider, such as Slack, Facebook or SalesForce.

For information about installing and configuring the SCIM connector, see "SCIM Connector".

### **Adobe Campaign Manager Connector**

The Adobe Campaign Manager connector enables you to manage profiles in an Adobe Campaign data store.

For information about installing and configuring the Adobe Campaign Manager connector, see "Adobe Campaign Manager Connector".

# Chapter 2 Generic LDAP Connector

The generic LDAP connector is based on JNDI, and can be used to connect to any LDAPv3-compliant directory server, such as ForgeRock Directory Services (DS), Active Directory, SunDS, Oracle Directory Server Enterprise Edition, IBM Security Directory Server, and OpenLDAP.

OpenICF provides a legacy Active Directory (AD) .NET connector. Note, however, that the AD Connector is deprecated and support for its use with IDM will be discontinued in a future release. For simple Active Directory (and Active Directory LDS) deployments, the generic LDAP Connector works better than the Active Directory connector, in most circumstances. Using the generic LDAP connector avoids the need to install a remote connector server in the overall deployment. In addition, the generic LDAP connector has significant performance advantages over the Active Directory connector. For more complex Active Directory deployments, use the PowerShell Connector Toolkit, as described in "PowerShell Connector Toolkit".

## 2.1. Setting Up the Generic LDAP Connector

IDM bundles version 1.4.6.0 of the LDAP connector. Three sample LDAP connector configurations are provided in the path/to/openidm/samples/example-configurations/provisioners/ directory:

- provisioner.openicf-opendjldap.json provides a sample LDAP connector configuration for a ForgeRock Directory Services (DS) server.
- provisioner.openicf-adldap.json provides a sample LDAP connector configuration for an Active Directory server.
- provisioner.openicf-adldsldap.json provides a sample LDAP connector configuration for an Active Directory Lightweight Directory Services (AD LDS) server.

You should be able to adapt one of these sample configurations for any LDAPv3-compliant server.

The connectorRef configuration property provides information about the LDAP connector bundle, and is the same in all three sample LDAP connector configurations:

```
{
  "connectorRef": {
     "connectorHostRef": "#LOCAL",
     "connectorName": "org.identityconnectors.ldap.LdapConnector",
     "bundleName": "org.forgerock.openicf.connectors.ldap-connector",
     "bundleVersion": "[1.4.0.0,2.0.0.0)"
  }
}
```

The connectorHostRef property is optional, if you use the connector .jar provided in openidm/connectors, and you use a local connector server.

The following excerpt shows the configuration properties in the sample LDAP connector for DS. These properties are described in detail later in this section. For additional information on the properties that affect synchronization, see "Controlling What the LDAP Connector Synchronizes". For a complete list of the configuration properties for the LDAP connector, see "LDAP Connector Configuration":

```
"configurationProperties" : {
    "host" : "localhost",
    "port" : 1389,
    "ssl" : false,
    "startTLS" : false,
    "privateKeyAlias" : null,
    "alternateKeyStore" : null,
    "alternateKeyStoreType" : null,
    "alternateKeyStorePassword" " null,
    "principal" : "cn=Directory Manager",
    "credentials" : "password",
    "baseContexts" : [
        "dc=example,dc=com"
    "baseContextsToSynchronize" : [
        "dc=example,dc=com"
    "accountSearchFilter" : null,
    "accountSynchronizationFilter" : null,
    "groupSearchFilter" : null,
    "groupSynchronizationFilter" : null,
    "passwordAttributeToSynchronize" : null,
    "synchronizePasswords" : false,
    "removeLogEntryObjectClassFromFilter" : true,
    "modifiersNamesToFilterOut" : [ ],
    "passwordDecryptionKey" : null,
    "changeLogBlockSize": 100,
   "attributesToSynchronize" : [ ],
"changeNumberAttribute" : "changeNumber",
    "passwordDecryptionInitializationVector" : null,
    "filterWithOrInsteadOfAnd" : false,
    "objectClassesToSynchronize" : [
        "inetOrgPerson"
   "vlvSortAttribute" : "uid",
    "passwordAttribute" : "userPassword",
    "useBlocks" : false,
    "maintainPosixGroupMembership" : false,
    "failover" : [ ],
    "readSchema" : true,
    "accountObjectClasses" : [
        "top",
        "person",
        "organizationalPerson",
        "inetOrgPerson"
    "accountUserNameAttributes" : [
        "uid"
   ],
```

```
"groupMemberAttribute" : "uniqueMember",
"passwordHashAlgorithm" : null,
"usePagedResultControl" : true,
"blockSize" : 100,
"uidAttribute" : "entryUUID",
"maintainLdapGroupMembership" : false,
"respectResourcePasswordPolicyChangeAfterReset" : false
},
```

#### host

The host name or IP address of the server on which the LDAP instance is running.

### port

The port on which the LDAP server listens for LDAP requests. The sample configuration specifies a default port of 1389.

#### ssl

If true, the specified port listens for LDAPS connections.

For instructions on using the LDAP connector over SSL, see "Configuring the LDAP Connector to Use SSL and StartTLS".

### startTLS

Specifies whether to use the startTLS operation to initiate a TLS/SSL session. To use startTLS, set "startTLS":true, and "ssl":false. Your connection should use the insecure LDAP port (typically 389 or 1389 for a DS server).

Specify the certificates that should be used for authentication, as described in "Configuring the LDAP Connector to Use SSL and StartTLS".

### principal

The bind DN that is used to connect to the LDAP server.

### credentials

The password of the principal that is used to connect to the LDAP server.

### baseContexts

One or more starting points in the LDAP tree that will be used when searching the tree. Searches are performed when discovering users from the LDAP server or when looking for the groups of which a user is a member. During reconciliation operations, IDM searches through the base contexts listed in this property for changes. (See also "Controlling What the LDAP Connector Synchronizes").

### baseContextsToSynchronize

One or more starting points in the LDAP tree that will be used to determine if a change should be synchronized. During liveSync operations, IDM searches through the base contexts listed in this property for changes. If no value is specified here, the values in listed in the baseContexts property are used. (See also "Controlling What the LDAP Connector Synchronizes").

### accountSynchronizationFilter

Used during synchronization actions to filter out LDAP accounts. (See also "Controlling What the LDAP Connector Synchronizes").

### accountObjectClasses

This property lists all the object classes that represent an account. If this property has multiple values, an AND filter is used to determine the affected entries. For example, if the value of this property is ["organizationalPerson", "inetOrgPerson"], any entry with the object class organizationalPerson AND the object class inetOrgPerson is considered as an account entry. You can override the value of this property by specifying the user object classes during the create operation.

If no object class is specified when you create a user, this property is used as the default list of object classes for the new entry.

### accountSearchFilter

Search filter that user accounts must match. (See also "Controlling What the LDAP Connector Synchronizes").

### accountUserNameAttributes

Attributes holding the account's user name. Used during authentication to find the LDAP entry matching the user name.

### attributesToSynchronize

List of attributes used during object synchronization. IDM ignores change log updates that do not include any of the specified attributes. If empty, IDM considers all changes. (See also "Controlling What the LDAP Connector Synchronizes").

### blockSize

Block size for simple paged results and VLV index searches, reflecting the maximum number of entries retrieved at any one time.

### changeLogBlockSize

Block size used when fetching change log entries.

### changeNumberAttribute

Change log attribute containing the last change number.

### failover

LDAP URLs specifying alternative LDAP servers to connect to if IDM cannot connect to the primary LDAP server specified in the host and port properties.

#### filterWithOrInsteadOfAnd

In most cases, the filter to fetch change log entries is AND-based. If this property is set, the filter ORs the required change numbers instead.

### groupMemberAttribute

LDAP attribute holding members for non-POSIX static groups.

### groupSearchFilter

Search filter that group entries must match.

### maintainLdapGroupMembership

If true, IDM modifies group membership when entries are renamed or deleted.

In the sample LDAP connector configuration file provided with IDM, this property is set to false. This means that LDAP group membership is not modified when entries are renamed or deleted in IDM. To ensure that entries are removed from LDAP groups when the entries are deleted, set this property to true or enable referential integrity on the LDAP server. For information about configuring referential integrity in DS, see *Configuring Referential Integrity* in the *Developer's Guide* for ForgeRock Directory Services.

### maintainPosixGroupMembership

If true, IDM modifies POSIX group membership when entries are renamed or deleted.

### modifiersNamesToFilterOut

Use this property to avoid loops caused by changes made to managed user objects being synchronized. For more information, see "Controlling What the LDAP Connector Synchronizes".

### objectClassesToSynchronize

IDM synchronizes only entries that have these object classes. See also "Controlling What the LDAP Connector Synchronizes".

### passwordAttribute

Attribute to which IDM writes the predefined PASSWORD attribute.

### passwordAttributeToSynchronize

IDM synchronizes password values on this attribute.

### passwordDecryptionInitializationVector

This is a legacy attribute, and its value should remain set to null. To configure password synchronization between an LDAP server and IDM, use one of the password synchronization plugins, described in the Password Synchronization Plugin Guide.

### passwordDecryptionKey

This is a legacy attribute, and its value should remain set to null. To configure password synchronization between an LDAP server and IDM, use one of the password synchronization plugins, described in the Password Synchronization Plugin Guide.

### passwordHashAlgorithm

Hash password values with the specified algorithm, if the LDAP server stores them in clear text.

The hash algorithm can be one of the following:

- NONE Clear text
- WIN-AD Used for password changes to Active Directory
- SHA Secure Hash Algorithm
- SHA-1 A 160-bit hash algorithm that resembles the MD5 algorithm
- SSHA Salted SHA
- MD5 A 128-bit message-digest algorithm
- SMD5 Salted MD5

### readSchema

If true, read the schema from the LDAP server.

This property is used only during the connector setup, to generate the object types.

If this property is false, the LDAP connector provides a basic default schema that can manage LDAP users and groups. The default schema maps inetOrgPerson to the OpenICF \_\_ACCOUNT\_\_ property, and groupOfUniqueNames to the OpenICF \_\_GROUP\_\_ property. The following LDAP object classes are also included in the default schema:

organization organizationalUnit

person organizationalPerson account groupOfNames

### removeLogEntryObjectClassFromFilter

If true, the filter to fetch change log entries does not contain the changeLogEntry object class, and IDM expects no entries with other object types in the change log. The default setting is true.

### respectResourcePasswordPolicyChangeAfterReset

If true, bind with the Password Expired and Password Policy controls, and throw PasswordExpiredException and other exceptions appropriately.

### synchronizePasswords

This is a legacy attribute, and its value should remain set to false. To configure password synchronization between an LDAP server and IDM, use one of the password synchronization plugins, described in the Password Synchronization Plugin Guide.

### uidAttribute

Specifies the LDAP attribute that should be used as the immutable ID for the entry. For a DS resource, you should use the <a href="entryUUID">entryUUID</a>. Although you can use a DN (or any unique attribute) for the <a href="eid">\_id</a>, as a best practice, you <a href="entryUUID">should</a> use an attribute that is both unique and immutable, such as the <a href="entryUUID">entryUUID</a>.

### useBlocks

If useBlocks is false, no pagination is used. If useBlocks is true, the connector uses block-based LDAP controls, either the simple paged results control, or the virtual list view control, depending on the setting of the usePagedResultControl property.

### usePagedResultControl

Taken into account only if useBlocks is true. If usePagedResultControl is false, the connector uses the virtual list view (VLV) control, if it is available. If usePagedResultControl is true, the connector uses the simple paged results control for search operations.

### **useTimestampsForSync**

If true, use timestamps for liveSync operations, instead of the change log.

By default, the LDAP connector has a change log strategy for LDAP servers that support a change log, such as ForgeRock Directory Services (DS) and Oracle Directory Server Enterprise Edition. If the LDAP server does not support a change log, or if the change log is disabled, liveSync for create and modify operations can still occur, based on the timestamps of modifications.

### vlvSortAttribute

Attribute used as the sort key for virtual list view.

### sendCAUDTxId

If true, propagate the Common Audit Transaction ID to a DS server.

# 2.2. Configuring the LDAP Connector to Use SSL and StartTLS

To use the LDAP connector over SSL, update your connector configuration file as follows:

1. For a connection over SSL, set the ssl property to true and set the port to a secure port, for example, 636.

To initiate a connection using startTLS, set "startTLS":true, and "ssl":false. Set the port to an insecure LDAP port, for example, 389.

2. If you are using a CA-signed server certificate, add that certificate to the IDM truststore, for example:

```
$ cd /path/to/openidm/security
$ keytool \
   -importcert \
   -alias server-cert \
   -keystore truststore \
   -storepass changeit \
   -file /path/to/server-cert.crt
```

3. Specify the certificate that the LDAP connector will use to authenticate to the remote LDAP server.

By default, the LDAP connector uses the self-signed certificate that is generated in the IDM keystore when IDM first starts up. You have two options to change this default behavior:

 Set the privateKeyAlias to the alias of a certificate in the IDM keystore. The alias name is casesensitive.

If you set privateKeyAlias to null, no private key is sent during the SSL handshake, so only the server certificate is used. You must import the server certificate into the IDM truststore, as shown in the previous step.

If privateKeyAlias is set to an alias within the IDM keystore, the connector uses that private key for SSL mutual authentication.

b. Specify a different keystore for the connector.

If you do not want to use the default IDM keystore, set the following properties:

• alternateKeyStore - specifies the full path to an alternate keystore.

- alternateKeyStoreType specifies alternate keystore type. Valid values are JKS, JCEKS and PKCS12.
- alternateKeyStorePassword specifies password for the alternate keystore.

## 2.3. Controlling What the LDAP Connector Synchronizes

To control the set of LDAP entries that are affected by reconciliation and automatic synchronization operations, set the following properties in the provisioner configuration. Automatic synchronization operations includes liveSync (synchronization of changes from the LDAP server to IDM) and implicit sync (synchronization from IDM to the LDAP server).

### baseContexts

The starting points in the LDAP tree that are used when searching the directory tree, for example, dc=example, dc=example, dc=com. These base contexts must include the set of users and the set of groups that must be searched during reconciliation operations.

### baseContextsToSynchronize

The starting points in the LDAP tree that are used to determine if a change should be synchronized. This property is used only for automatic synchronization operations. Only entries that fall under these base contexts are considered during synchronization operations.

#### accountSearchFilter

Only user accounts that match this filter are searched, and therefore affected by reconciliation and synchronization operations. If you do not set this property, all accounts within the base contexts specified previously are searched.

### accountSynchronizationFilter

This property is used during reconciliation and automatic synchronization operations, and filters out any LDAP accounts that you specifically want to exclude from these operations.

### objectClassesToSynchronize

During automatic synchronization operations, only the object classes listed here are considered for changes. IDM ignores change log updates (or changes to managed objects) which do not have any of the object classes listed here.

### attributesToSynchronize

During automatic synchronization operations, *only* the attributes listed here are considered for changes. Objects that include these attributes are synchronized. Objects that do not include these attributes are ignored. If this property is not set, IDM considers changes to all attributes specified in the mapping. Automatic synchronization includes liveSync and implicit

synchronization operations. For more information, see "Types of Synchronization" in the Integrator's Guide

This attribute works only with LDAP servers that log changes in a change log, not with servers (such as Active Directory) that use other mechanisms to track changes.

### modifiersNamesToFilterOut

This property enables you to define a list of DNs. During synchronization operations, the connector ignores changes made by these DNs.

When a managed user object is updated, and that change is synchronized to the LDAP server, the change made on the LDAP server is recorded in the change log. A liveSync operation picks up the change, and attempts to replay the change on the managed user object, effectively resulting in a loop of updates.

To avoid this situation, you can specify a unique user in your LDAP directory, that will be used *only* for the LDAP connector. The unique user must be something other than <code>cn=directory</code> <code>manager</code>, for example <code>cn=openidmuser</code>. You can then include that user DN as the value of <code>modifiersNamesToFilterOut</code>. When a change is made through the LDAP connector, and that change is recorded in the change log, the modifier's name (<code>cn=openidmuser</code>) is flagged and IDM does not attempt to replay the change back to the managed user repository. So you are effectively indicating that IDM should not synchronized changes back to managed user that originated from managed user, thus preventing the update loop.

This attribute works only with LDAP servers that log changes in a change log, not with servers (such as Active Directory) that use other mechanisms to track changes.

# 2.4. Using the Generic LDAP Connector With Active Directory

The LDAP connector provides functionality specifically for managing Active Directory users and groups. The connector can handle the following operational attributes to manage Active Directory accounts:

• ENABLE - uses the userAccountControl attribute to get or set the account status of an object.

The LDAP connector reads the <u>userAccountControl</u> to determine if an account is enabled or disabled. The connector modifies the value of the <u>userAccountControl</u> attribute if IDM changes the value of <u>ENABLE</u>.

- ACCOUNT EXPIRES gets or sets the account Expires attribute of an Active Directory object.
- \_\_LOCK\_OUT\_ uses the msDS-User-Account-Control-Computed system attribute to check if a user account has been locked.

If IDM sets the <u>LOCK\_OUT\_</u> to <u>FALSE</u>, the LDAP connector sets the Active Directory <u>lockoutTime</u> to <u>0</u> to unlock the account.

If IDM sets the LOCK OUT to TRUE, the LDAP connector ignores the change and logs a message.

 \_\_PASSWORD\_EXPIRED\_\_ - uses the msDS-User-Account-Control-Computed system attribute to check if a user password has expired.

To force password expiration (to force a user to change their password when they next log in), pwdLastSet must be set to 0. The LDAP connector sets pwdLastSet to 0, if IDM sets \_\_PASSWORD\_EXPIRED\_\_
to TRUE.

To remove password expiration, pwdLastSet must be set to 0 and then -1. This sets the value of pwdLastSet to the current time. The LDAP connector sets pwdLastSet to -1 if IDM sets \_\_PASSWORD\_EXPIRED\_\_ to FALSE.

#### Note

Active Directory does not allow you to create an enabled account with an expired password. If you are using <code>\_PASSWORD\_EXPIRED\_</code> to force a new user to change their password when they next log in, you can create the user account as disabled initially (<code>\_ENABLE\_\_=false</code>). You can then patch the new user account to enable it. You can use the same workaround for synchronization operations, creating new user accounts as disabled, then issuing an <code>openidm.patch</code> call in a <code>postCreate</code> script to enable the account.

The sample connector configuration file (openidm/samples/example-configurations/provisioners/provisioner.openicf-adldap.json) includes these operational attributes.

### 2.4.1. Managing Active Directory Users With the LDAP Connector

If you create or update users in Active Directory, and those user entries include passwords, you *must* use the LDAP connector over SSL. You cannot create or update an Active Directory user password in clear text. To use the connector over SSL, follow the instructions in "Configuring the LDAP Connector to Use SSL and StartTLS".

The following command adds an Active Directory user. The output shows the operational attributes described in the previous section:

```
http://localhost:8080/openidm/system/ad/account? action=create
 " id": "<GUID=cb2f8cbc032f474c94c896e69db2feb3>",
 "mobile": null,
 "postalCode": null,
 "st": null,
 "employeeType": null,
 "objectGUID": "<GUID=cb2f8cbc032f474c94c896e69db2feb3>",
 "cn": "Brian Smith",
 "department": null,
 "l": null,
 "description": null,
 "info": null,
 "manager": null,
 "sAMAccountName": "bsmith",
 "sn": null,
 "whenChanged": "20151217131254.0Z"
 "userPrincipalName": "bsmith@example.com",
 "userAccountControl": "512",
  __ENABLE__": true,
 "displayName": null,
 "givenName": "Brian",
 "middleName": null,
 "facsimileTelephoneNumber": null,
 "lastLogon": "0",
 "countryCode": "0"
 "employeeID": null,
 "co": null,
 "physicalDeliveryOfficeName": null,
 "pwdLastSet": "2015-12-17T13:12:54Z",
 "streetAddress": null,
 "homePhone": null,
  PASSWORD NOTREQD ": false,
 "telephoneNumber": null,
 "dn": "CN=Brian Smith, CN=Users, DC=example, DC=com",
 "title": null,
 "mail": "bsmith@example.com",
 "postOfficeBox": null,
   _SMARTCARD_REQUIRED__": false,
 "uSNChanged": "86144",
  PASSWORD EXPIRED ": false,
 "initials": null,
 " LOCK OUT ": false,
 "company": null,
 "employeeNumber": null,
 "accountExpires": "0",
 "c": null,
 "whenCreated": "20151217131254.0Z",
 "uSNCreated": "86142",
 "division": null,
 "groups": [],
  DONT EXPIRE PASSWORD ": false,
 "otherHomePhone": []
```

Note that the command sets the <u>userAccountControl</u> to 512, which is an <u>enabled</u> account. The value of the <u>userAccountControl</u> determines the account policy. The following list describes the common values for the <u>userAccountControl</u>.

E 1	1	1

Enabled account.

### 514

Disabled account.

### 544

Enabled account, password not required.

#### 546

Disabled account, password not required.

### 66048

Enabled account, password does not expire.

### 66050

Disabled account, password does not expire.

### 66080

Enabled account, password does not expire and is not required.

### 66082

Disabled account, password does not expire and is not required.

### 262656

Enabled account, smartcard required.

### 262658

Disabled account, smartcard required.

### 262688

Enabled account, smartcard required, password not required.

### 262690

Disabled account, smartcard required, password not required.

### 328192

Enabled account, smartcard required, password does not expire.

### 328192

Enabled account, smartcard required, password does not expire.

### 328194

Disabled account, smartcard required, password does not expire.

### 328224

Enabled account, smartcard required, password does not expire and is not required.

### 328226

Disabled account, smartcard required, password does not expire and is not required.

### 2.4.2. Managing Active Directory Groups With the LDAP Connector

The following command creates a basic Active Directory group with the LDAP connector:

```
$ curl \
--header "Content-Type: application/json" \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request POST \
--data '{
    "dn": "CN=Employees, DC=example, DC=com"
}' \
http://localhost:8080/openidm/system/ad/group?_action=create
{
    "_id": "<GUID=240da4e959d81547ad8629f5b2b5114d>"
}
```

The LDAP connector exposes two special attributes to handle Active Directory group scope and type: GROUP SCOPE and GROUP TYPE.

The GROUP SCOPE attribute is defined in the provisioner configuration as follows:

```
...
"__GROUP_SCOPE__" : {
    "type" : "string",
    "nativeName" : "__GROUP_SCOPE__",
    "nativeType" : "string"
},
```

The value of the GROUP\_SCOPE attribute can be global, domain, or universal. If no group scope is set when the group is created, the scope is global by default. For more information about the different group scopes, see the corresponding Microsoft documentation.

The GROUP TYPE attribute is defined in the provisioner configuration as follows:

```
...
"__GROUP_TYPE__" : {
  "type" : "string",
  "nativeName" : "__GROUP_TYPE__",
  "nativeType" : "string"
},
```

The value of the GROUP\_TYPE attribute can be security or distribution. If no group type is set when the group is created, the type is security by default. For more information about the different group types, see the corresponding Microsoft documentation.

The following example creates a new distribution group, with universal scope:

```
$ curl \
--header "Content-Type: application/json" \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request POST \
--data '{
   "dn": "CN=NewGroup,DC=example,DC=com",
   "__GROUP_SCOPE__": "universal",
   "__GROUP_TYPE__": "distribution"
} \
http://localhost:8080/openidm/system/ad/group?_action=create
{
   "_id": "<GUID=f189df8a276f91478ad5055b1580cbcb>"
}
```

### 2.4.3. Handling Active Directory Dates

Most dates in Active Directory are represented as the number of 100-nanosecond intervals since January 1, 1601 (UTC). For example:

```
pwdLastSet: 130698687542272930
```

IDM generally represents dates as an ISO 8601-compliant string with yyyy-MM-dd'T'HH:mm:ssZ format. For example:

```
2015-03-02T20:17:48Z
```

The generic LDAP connector therefore converts any dates from Active Directory to ISO 8601 format, for fields such as pwdLastSet, accountExpires, lockoutTime, and lastLogon.

### 2.4.4. Working with Multiple Active Directory Domains

In a multi-domain Active Directory Domain Services (AD DS) forest, the global catalog (GC) provides a read-only (searchable) representation of every object in the forest. Each domain controller (DC) in the forest stores a writable replica of the objects *in its domain*. Therefore, a DC can locate only the objects in its domain.

If your Active Directory deployment has only one domain controller, you can configure the connector to connect to that single domain controller. If your deployment spans multiple domains, you must configure the connector to connect to the Global Catalog (GC) to have a comprehensive view of all the domains.

Using a GC as the authoritative data source has the following limitations:

• Only a subset of attributes is replicated from other domains to the GC.

Certain attributes required by the LDAP connector might be missing. To avoid this problem, modify the Active Directory schema to ensure that the required attributes are replicated to the GC.

• Delete operations are not detected immediately.

A liveSync operation will therefore not update IDM with the result of a delete operation. Delete operations are detected by a reconciliation operation, so data stores are only temporarily "out of sync" with regard to deletes.

· Not all group types are supported.

Group membership information is replicated to the GC for universal groups only. You must therefore use universal groups if your directory service has more than one domain.

### Note

You can use the USN value for liveSync but *must* connect to the GC in this case, and ensure that you never failover to a different GC or to a DC. Using the USN for liveSync instead of the timestamp mechanism is generally preferred, because of the issue with detecting delete operations.

# 2.5. Constructing the LDAP Search Filter

The LDAP connector constructs an LDAP search filter using a combination of filters, in the following order:

```
(& (native filter) (user filter) (object class filter) )
```

The filter components are as follows:

### Native Filter

The native filter is the query filter that has been translated to an LDAP query. For example, uid+eq +"user123" is translated to uid=user123.

This part of the filter is processed first.

### **User Filter**

You can define a user filter with the properties accountSearchFilter and groupSearchFilter in the connector configuration.

These properties enable you to construct a more granular or specific search filter. If a user filter is specified, the connector does not use the object class filter. If no user filter is specified, (accountSearchFilter and groupSearchFilter set to null or absent from the connector configuration), the connector uses the object class filter.

### **Object Class Filter**

This part of the filter includes the object classes that the entry must have in order to be returned by the search.

The \_ACCOUNT\_ and \_GROUPS\_ object classes are defined by the properties accountObjectClasses and groupObjectClasses in the connector configuration. For example, the following excerpt of a sample provisioner.openicf-ldap.json file indicates that the accountObjectClasses include the LDAP object classes top, person, organizationalPerson, and inetOrgPerson:

```
"configurationProperties" : {
    ...
    "accountObjectClasses" : [
        "top",
        "person",
        "organizationalPerson",
        "inetOrgPerson"
    ]
...
```

With this configuration, the search filter for accounts is constructed as follows:

```
(\& (objectClass = top) (objectClass = person) (objectClass = organizational Person) (objectClass = inetOrgPerson))\\
```

If no accountObjectClasses or groupObjectClasses are defined in the connector configuration, the connector uses the name of the OpenICF ObjectClass in the filter. For example, an object of type organizationUnit will result in:

```
(&(objectClass=organizationUnit)
```

# 2.6. OpenICF Interfaces Implemented by the LDAP Connector

The LDAP Connector implements the following OpenICF interfaces.

### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

### Create

Creates an object and its uid.

### **Delete**

Deletes an object, referenced by its uid.

### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

### Schema

Describes the object types, operations, and options that the connector supports.

### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### Search

Searches the target resource for all objects that match the specified object class and filter.

### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

### **Update**

Updates (modifies or replaces) objects on a target resource.

### 2.7. LDAP Connector Configuration

The LDAP Connector has the following configurable properties.

## 2.7.1. Configuration Properties

	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>

List all servers that should be used f fails, JNDI will connect to the next a ldap.example.com:389/", which follo port parts of the URL are relevant in	vailable server in t ws the standard Ll	he list. List all serv	ers in the form of "	dap://
port	int	389		No
TCP/IP port number used to commun	nicate with the LD	AP server.		
passwordAttribute	String	userPassword		No
The name of the LDAP attribute that is set to this attribute.	holds the passwor	rd. When changing	a users password, t	the new password
useDNSSRVRecord	boolean	false		No
If true, the connector will do a DNS ("_ldaptcp.example.com" for examp			with the value set f	or host property
getGroupMemberId	boolean	false		No
Specifies whether to add an extra _n	nemberId attribute	to get the group n	nembersUID	
startTLS	boolean	false		No
Specifies whether to use the startTL	S operation to init	iate a TLS/SSL sess	sion.	
allowTreeDelete	boolean	false		No
Connector can delete an entry (node control LDAP_SERVER_TREE_DELE	) with leaf entry if TE_OID (1.2.840.1	this value is set to 13556.1.4.805) is u	true (defaults to falused.	se). The LDAP
respectResourcePasswordPolicyChange	boolean	false		No
When this resource is specified in a and the resource's password policy is password has been administratively authenticating.	s configured for cl	nange-after-reset, a	user whose resour	ce account
uidAttribute	String	entryUUID		No
The name of the LDAP attribute that	is mapped to the	OpenICF UID attrik	oute.	
principal	String	null		No
The distinguished name with which t	to authenticate to	the LDAP server.		
accountObjectClasses	String[]	['top', 'person', 'organizational		No

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
		, 'inetOrgPerso	on'	
The default list of object classes be overridden by specifying the				DAP tree. This can
alternateKeyStoreType	String	null		No
Defines the type of the alternate	key store. Valid va	alues are JKS, JCEKS	and PKCS12	
passwordHashAlgorithm	String	null		No
Indicates the algorithm that the are SSHA, SHA, SMD5, MD5 an will not hash passwords. This wiperforms the hash (as Forgerock	d WIN-AD (when A ill cause clear text )	D is the target). A bl passwords to be stor	lank value indicates	s that the system
alternateKeyStore	String	null		No
Defines the filename of an altern specified by the javax.net.ssl.key		ecified, the connecto	or will not use the d	lefault keystore
authType	String	simple		No
The authentication mechanism t	to use: Simple or SA	ASL-GSSAPI. Default	ts to "simple".	
useBlocks	boolean	false		No
Specifies whether to use block-b performing search operations or	n large numbers of			
Specifies whether to use block-be performing search operations or amount of memory used by the creadSchema	n large numbers of			
Specifies whether to use block-be performing search operations or amount of memory used by the o	boolean the schema from the	true e server. If false, the	are returned in bloo	No vide a default
Specifies whether to use block-beneforming search operations or amount of memory used by the creadSchema  If true, the connector will read to schema based on the object class object classes.	boolean the schema from the	true e server. If false, the	are returned in bloo	No vide a default
Specifies whether to use block-beneforming search operations or amount of memory used by the creadSchema  If true, the connector will read to schema based on the object class	boolean  boolean  boolean  boolean  boolean  boolean	true e server. If false, the ation. This property	e connector will promust be true in ord	No wide a default ler to use extended

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# CSV File Connector

The CSV file connector is useful when importing users, either for initial provisioning or for ongoing updates. When used continuously in production, a CSV file serves as a change log, often containing only user records that have changed.

## 3.1. Configuring the CSV File Connector

A sample CSV file connector configuration is provided in openidm/samples/example-configurations/provisioners/provisioner.openicf-csv.json.

The following example shows an excerpt of the provisioner configuration. The connectorHostRef property is optional and must be provided only if the connector runs remotely.

```
{
  "connectorRef": {
    "connectorHostRef": "#LOCAL",
    "connectorName": "org.forgerock.openicf.csvfile.CSVFileConnector",
    "bundleName": "org.forgerock.openicf.connectors.csvfile-connector",
    "bundleVersion": "[1.5.1.4,1.6.0.0)"
  }
}
```

The following excerpt shows the *required* configuration properties:

```
"configurationProperties" : {
    "csvFile" : "&{launcher.project.location}/data/csvConnectorData.csv"
},
```

### csvFile

The path to the CSV file that is the data source for this connector.

The CSV file connector also supports following optional configuration properties:

#### headerUid

The CSV header that maps to the uid (or name) for each row.

Default: uid

### encodina

Default: utf-8

### headerPassword

The CSV header that maps to the password for each row. Use this property when password-based authentication is required.

### **fieldDelimiter**

The character in the CSV file that is used to separate field values.

Default: ,

### quoteCharacter

The character in the CSV file that is used to encapsulate strings.

Default: "

### newlineString

The character string in the CSV file that is used to terminate each line.

Default: \n

### syncFileRetentionCount

The number of historical copies of the CSV file to retain when performing synchronization operations.

Default: 3

# 3.2. OpenICF Interfaces Implemented by the CSV File Connector

The CSV File Connector implements the following OpenICF interfaces.

### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

### **Batch**

Execute a series of operations in a single request.

### Create

Creates an object and its uid.

### Delete

Deletes an object, referenced by its uid.

### Resolve Username

Resolves an object by its username and returns the uid of the object.

### Schema

Describes the object types, operations, and options that the connector supports.

### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### Search

Searches the target resource for all objects that match the specified object class and filter.

### Sync

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

### **Update**

Updates (modifies or replaces) objects on a target resource.

# 3.3. CSV File Connector Configuration

The CSV File Connector has the following configurable properties.

# 3.3.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
headerPassword	String	password		No
Name of the password column	as found in the CSV	file		
csvFile	File	null		Yes
Full path to the CSV file				
newlineString	String			No
Character(s) used to terminate	e a line in the CSV fil	e		
headerUid	String	uid		No
Name of the uid column as fou	nd in the CSV file			
quoteCharacter	String	u u		No
Character used to quote fields				
fieldDelimiter	String	,		No
Character used to delimit colu	mnar fields			
syncFileRetentionCount	int	3		No
Number of sync history files to	retain			

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# Chapter 4

# **Database Table Connector**

The Database Table connector enables provisioning to a single table in a JDBC database.

# 4.1. Configuring the Database Table Connector

A sample connector configuration for the Database Table connector is provided in samples/
example-configurations/provisioners/provisioner.openicf-contractordb.json. The corresponding data
definition language file is provided in samples/example-configurations/provisioners/provisioner.openicf-contractordb.sql.

The following excerpt shows the settings for the connector configuration properties in the sample Database Table connector:

```
"configurationProperties" :
      "quoting" : ""
      "host" : "localhost",
      "port" : "3306".
      "user" : "root",
      "password" : "",
      "database" : "contractordb",
      "table" : "people",
      "keyColumn" : "UNIQUE ID",
      "passwordColumn" : "",
      "idbcDriver" : "com.mysql.idbc.Driver",
      "jdbcUrlTemplate" : "jdbc:mysql://%h:%p/%d",
      "enableEmptyString" : false,
      "rethrowAllSQLExceptions" : true,
      "nativeTimestamps" : true,
      "allNative" : false,
      "validConnectionQuery" : null,
      "changeLogColumn" : "CHANGE TIMESTAMP",
      "datasource" : ""
      "jndiProperties" : null
   },
```

The mandatory configurable properties are as follows:

#### database

The JDBC database that contains the table to which you are provisioning.

#### table

The name of the table in the JDBC database that contains the user accounts.

#### keyColumn

The column value that is used as the unique identifier for rows in the table.

# 4.2. Implementation Specifics

To use this connector for liveSync, add a changelog type column to the database and provide the name of this column in the changeLogColumn property. Note that the Database Table connector supports liveSync for create and update operations only. To detect deletes in the database you must run a full reconciliation.

For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The Database Table connector does not implement the add or remove operations, so a PATCH request always replaces the entire attribute value with the new value.

# 4.3. OpenICF Interfaces Implemented by the Database Table Connector

The Database Table Connector implements the following OpenICF interfaces.

#### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

• The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.

- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

# 4.4. Database Table Connector Configuration

The Database Table Connector has the following configurable properties.

# 4.4.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
quoting	String			No		
Select whether database column names for this resource should be quoted, and the quoting characters. By default, database column names are not quoted (None). For other selections (Single, Double, Back, or Brackets), column names will appear between single quotes, double quotes, back quotes, or brackets in the SQL generated to access the database.						
host	String			No		
Enter the name of the host on which	the database is rui	nning.				

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
oort	String			No
Enter the port number on wl	nich the database serv	er is listening.		
user	String			No
Enter the name of the manda	atory Database user w	ith permission to ac	cess the accounts to	ible.
password	GuardedString	g null	Yes	No
Enter a user account that ha	s permission to access	s the accounts table.		
database	String			No
Enter the name of the datab	ase on the database se	erver that contains th	he table.	
table	String			Yes
Enter the name of the table	n the database that co	ontains the accounts		
keyColumn	String			Yes
This mandatory column valu	e will be used as the u	nique identifier for 1	rows in the table.	
passwordColumn	String			No
Enter the name of the colum resources and passwords.	n in the table that will	hold the password	values. If empty, no	validation is done
jdbcDriver	String	oracle.jdbc .driver .OracleDriver		No
Specify the JDBC Driver clas org.gjt.mm.mysql.Driver. Ca			acleDriver. For MyS	QL:
jdbcUrlTemplate	String	jdbc:oracle:t %h:%p:%d	hin	No
Specify the JDBC Driver Con MySQL template is jdbc:mys Could be empty if datasource	ql://[host]:[port(3306)]			
enableEmptyString	boolean	false		No
Select to enable support for defined as not-null in the tab based tables. By default emp	le schema. This option	n does not influence	L value, in characte the way strings are	r based columns written for Oracle
rethrowAllSQLExceptions	boolean	true		No
TC-1 1 1 1 00T .	atements which throw	SQLExceptions wit		
If this is not checked, SQL st exception caught and suppre			ErrorCodes rethrow	n.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
Select to retrieve Timestamp data t	ype of the columns i	n java.sql.Timesta	mp format from the	database table.		
allNative	boolean	false		No		
Select to retrieve all data types of columns in native format from the database table.						
validConnectionQuery	String	null		No		
Specify whether the check connecti the connection by switching autocor from a dummy table.						
changeLogColumn	String			Sync		
The change log column stores the la	itest change time. P	roviding this value	the Sync capabiliti	es are activated.		
datasource	String			No		
If specified, the connector will atternesource parameters. For example:			rce, and will ignore	other specified		
jndiProperties	String[]	null		No		
Could be empty or enter the JDBC J	NDI Initial context f	actory, context pro	ovider in a format: l	xey = value.		
suppressPassword	boolean	true		No		
If set to true then the password will false then the password will be retu			it is explicitly reque	ested. If set to		

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM. <sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# PowerShell Connector Toolkit

The PowerShell Connector Toolkit is not a complete connector in the traditional sense. Rather, it is a framework within which you must write your own PowerShell scripts to address the requirements of your Microsoft Windows ecosystem. You can use the PowerShell Connector Toolkit to create connectors that can provision any Microsoft system, including, but not limited to, Active Directory, MS SQL, MS Exchange, SharePoint, Azure, and Office365. Essentially, any task that can be performed with PowerShell can be executed through connectors based on this toolkit.

The PowerShell Connector Toolkit is available from ForgeRock's BackStage site.

IDM includes Active Directory and Azure sample scripts for the PowerShell connector that can help you get started with this toolkit. For more information, see "Connecting to Active Directory With the PowerShell Connector" in the Samples Guide and "Connecting to Azure AD With the PowerShell Connector" in the Samples Guide.

The sample scripts illustrate the following scenarios:

- Synchronization of users between Windows AD DS and IDM.
- Synchronization of users between Windows Azure AD and IDM.

## 5.1. Before You Start

To implement a scripted PowerShell connector, you must install the following:

- Microsoft .NET Framework 4.5 or later. Connectors created with the PowerShell Connector Toolkit run on the .NET platform and require the installation of a .NET connector server on the Windows system. To install the .NET connector server, follow the instructions in "Installing and Configuring a .NET Connector Server" in the *Integrator's Guide*.
- PowerShell version 4.0 or above.
- The PowerShell Connector Toolkit.

# 5.2. Setting Up the PowerShell Connector

To run the commands in this procedure, start with the PowerShell command line. Some of the commands in this procedure require administrative privileges.

1. Install, configure, and start the .NET connector server on a Windows host. If you are running an Active Directory Domain Controller, install the .NET connector server on the same host on which the Windows PowerShell module is installed.

For instructions on installing the .NET connector server, see "Installing and Configuring a .NET Connector Server" in the *Integrator's Guide*.

2. Configure IDM to connect to the .NET connector server.

To do so, copy the remote connector provisioner file from the <code>openidm\samples\provisioners</code> directory to your project's <code>conf\</code> directory, and edit the file to match your configuration.

```
PS C:\ cd \path\to\openidm
PS C:\path\to\openidm cp samples\provisioners\provisioner.openicf.connectorinfoprovider.json conf
```

For instructions on editing this file, see "Configuring IDM to Connect to the .NET Connector Server" in the *Integrator's Guide*.

3. Download the PowerShell Connector Toolkit archive (mspowershell-connector-1.4.4.0.zip) from ForgeRock's BackStage site.

Extract the archive and move the MsPowerShell.Connector.dll to the folder in which the connector server application executable file (ConnectorServerService.exe) is located.

4. Sample PowerShell scripts are provided in the openidm\samples\ directory. The scripted-powershell-with-ad directory contains scripts for a connection to Active Directory, and the scripted-powershell-with-azure-ad contains scripts for a connection to Azure AD. Copy these scripts to the host on which the .NET connector server is installed.

The full path to the scripts must be referenced in your connector configuration file (provisioner.openicf-\*.json), for example:

```
"CreateScriptFileName" : "C:/openidm/samples/scripted-powershell-with-ad/tools/ADCreate.ps1", ...
```

5. Copy the sample connector configuration for the PowerShell connector from the samples provisioners directory to your project's conf directory.

IDM includes two sample PowerShell connector configurations:

- Active Directory: provisioner.openicf-adpowershell.json
- Azure AD: provisioner.openicf-azureadpowershell.json

Verify that at least the path to the scripts and the connection and authentication details are correct for your deployment. The following section describes the configurable properties in the sample connector configuration files.

#### Note

Paths in these files must use forward slash characters and not the backslash characters that you would expect in a Windows path.

# 5.3. Configuring the PowerShell Connector

Your PowerShell connector configuration file should include the following properties:

Property	Туре	Example	Encrypted <sup>a</sup>	Required <sup>b</sup>
operationScriptFileName	String	C:/openidm/ AD/ADCreate .psl, C:/openidm /samples/ scripted- powershell- with-azure-ad/ azureADScripts /AzureADDelete .psl	No	Yes
The full path to the script that imp	plements the corresp	onding OpenICF op	eration.	
VariablesPrefix	String	Connector	No	No
To avoid variable namespace confinjected into the script under that				All variables are
QueryFilterType	String	AdPsModule (for AD), Map (for Azure AD)	No	Yes
<ul> <li>connector. Possible values are:</li> <li>Map - the query filter is a map</li> <li>Ldap - the query filter is in LDAP</li> <li>Native - the query filter is a national particle.</li> </ul>	search format, for e	xample, "(cn=Joe)" ter		·
A configurable query filter visitor connector. Possible values are:  • Map - the query filter is a map  • Ldap - the query filter is in LDAF  • Native - the query filter is a nati  • AdPsModule - the query filter is co	search format, for every file of the compatible with the A	xample, "(cn=Joe)" ter ctive Directory Pow	erShell module, G	et-ADUser Filter
<ul> <li>connector. Possible values are:</li> <li>Map - the query filter is a map</li> <li>Ldap - the query filter is in LDAP</li> <li>Native - the query filter is a national particle.</li> </ul>	e search format, for every openICF query filompatible with the Augusta Boolean the script from disk	xample, "(cn=Joe)" ter ctive Directory Pow	erShell module, G No	et-ADUser Filter No
<ul> <li>connector. Possible values are:</li> <li>Map - the query filter is a map</li> <li>Ldap - the query filter is in LDAP</li> <li>Native - the query filter is a nati</li> <li>AdPsModule - the query filter is consequence</li> <li>ReloadScriptOnExecution</li> <li>When true, the connector reloads</li> </ul>	e search format, for every openICF query filompatible with the Augusta Boolean the script from disk	xample, "(cn=Joe)" ter ctive Directory Pow	erShell module, G No	et-ADUser Filter No

Property	Туре	Example	Encrypted <sup>a</sup>	Required <sup>b</sup>
MaxInterpretersPoolSize	Integer	5	No	No
The maximum size of the interprete	er pool.			
MinInterpretersPoolSize	Integer	1	No	No
The minimum size of the interprete	r pool.			
SubstituteUidAndNameInQueryFilter	Boolean	true	No	No
Specifies whether theUID and _ and UidAttributeName in the query f		be replaced by the valu	e defined in the N	NameAttributeName
UidAttributeName	String	ObjectGUID (AD), ObjectId (AzureAD)	No	No
The attribute on the resource that $\sigma$	contains the obje	ectUID		
NameAttributeName	String	DistinguishedName (AD), UserPrincipalName (AzureAD)		No
The attribute on the resource that o	contains the obje	ectNAME		
PsModulesToImport	Array	["ActiveDirector (AD), ["MSOnline"] (AzureAD)	No	No
An array of additional PowerShell r	nodules that the	connector must impor	t	
Host	String	(AD), (AzureAD)	No	Yes
The host name or IP address of the	resource (Active	e Directory or Azure AI	))	
Port	Integer	null	No	Yes
The port number on which the rem	ote resource list	ens for connections		
Login	String	1111	No	Yes
The user account in the remote $\operatorname{res}$	ource that is use	ed for the connection		
Password	String	null	Encrypted	Yes
Γhe password of the user account t	hat is used for th	ne connection		
CustomProperties	Array	[]	No	No
An array of Strings to define custor For example:	n configuration j	properties. Each prope	rty takes the forn	nat "name=value".
<pre>"configurationProperties" : {      "CustomProperties" : ["baseC     },</pre>	ontext = CN=Use	rs,DC=example,DC=com"	1,	

Property	Туре	Example	Encrypted <sup>a</sup>	Required <sup>b</sup>	
The custom property can then be read from the PowerShell scripts as follows: \$base = \$Connector					
.Configuration.PropertyBag.baseCont	ext				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in IDM.

# 5.4. Testing the PowerShell Connector

Start IDM with the configuration for your PowerShell connector project.

The following tests assume that the configuration is in the default path/to/openidm directory. If your PowerShell project is in a different directory, use the startup command with the -p option to point to that directory.

```
$ cd path/to/openidm
$ ./startup.sh
```

### 5.4.1. Confirming the Connector Configuration

To test that the PowerShell connector has been configured correctly, run the following REST call:

```
$ curl \
    --header "X-OpenIDM-Username: openidm-admin" \
    --header "X-OpenIDM-Password: openidm-admin" \
    --request POST \
    "http://localhost:8080/openidm/system?_action=test"
{
    "name" : "azureadpowershell",
    "enabled" : true,
    "config" : "config/provisioner.openicf/azureadpowershell",
    "objectTypes" : [ "__ALL__", "group", "account" ],
    "connectorRef" : {
        "connectorName" : "Org.Forgerock.OpenICF.Connectors.MsPowerShell.MsPowerShellConnector",
        "bundleName" : "MsPowerShell.Connector",
        "bundleVersion" : "[1.4.3.0,1.5.0.0)"
    },
    "displayName" : "PowerShell Connector",
    "ok" : true
}
```

The displayed output demonstrates a successful configuration of an Azure AD connector.

When you run this test, you should also see a log entry associated with the .NET connector server, in the logs/ subdirectory of that server.

### 5.4.2. Searching With the Connector

You can use the connector, with a PowerShell search script, to retrieve information from a target system. The PowerShell search script accepts IDM queries, including query-all-ids and \_queryFilter

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

With the following command, you can retrieve a list of existing users on an Azure AD system. You can also use any system-enabled filter, such as those described in "Presence Expressions" in the *Integrator's Guide*.

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request GET \
"http://localhost:8080/openidm/system/azureadpowershell/account?_queryId=query-all-ids"
```

### 5.4.3. Creating With the Connector

You can use the connector to create new users or groups on the target system, based on options listed in the relevant provisioner.openicf-\* configuration file.

For example, the following command creates a new user on a remote Azure AD instance:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin"
\--header "X-OpenIDM-Password: openidm-admin"
--request POST
--header "content-type: application/json"
--data '{
    "PasswordNeverExpires": false,
    "AlternateEmailAddresses": ["Robert.Smith@example.com"],
    "LastName": "Smith",
    "PreferredLanguage": "en-US",
    "FirstName": "Robert",
    "UserPrincipalName": "Robert.Smith@example.onmicrosoft.com",
    "DisplayName": "Robert Smith"
} \
"http://localhost:8080/openidm/system/azureadpowershell/account?_action=create"
```

## 5.4.4. Updating With the Connector

The PowerShell scripts associated with update functionality support changes to the following properties:

- Password
- Principal Name
- License
- Common user attributes

As an example, you could use the following command to change the password for the user with the noted \_id:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin"
\--header "X-OpenIDM-Password: openidm-admin"
\--request PATCH
--header "content-type: application/json"
\--data '{
    "operation": "replace",
    "Field": "password",
    "value": "Passwlrd"
}' \
"http://localhost:8080/openidm/system/azureadpowershell/account/1d4c9276-6937-4d9e-9c60-67e8b4207f4e"
```

### 5.4.5. Deleting With the Connector

You can use the PowerShell connector to delete user and group objects. As an example, the following command deletes one user from an Azure AD deployment, based on their id:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin"
\
--header "X-OpenIDM-Password: openidm-admin"
\
--request DELETE \
"http://localhost:8080/openidm/system/azureadpowershell/account/1d4c9276-6937-4d9e-9c60-67e8b4207f4e"
```

# 5.5. Debugging Scripts Running in the PowerShell Connector

The PowerShell connector uses runspaces to execute the scripts for each action (create, update, search, and so on). A *runspace* is an instance of the Windows PowerShell interpreter within the PowerShell connector. A runspace essentially creates a new thread on an existing process. The connector can also use an interpreter pool and have several runspace instances running within the connector. This makes the connector more efficient under a heavy load. The interpreter pool can be shared between connector instances.

The following image shows how multiple connector instances use an interpreter pool with multiple runspaces:

#### NET Connector Server PowerShell PowerShell PowerShell PowerShell Connector Connector Connector Connector Instance 1 Instance 2 Instance 3 Instance 4 Interpreter Pool If (\$value -gt 0) SConnector.Uid = unspaces PowerShell code executed by the Runspace

#### PowerShell Connector and Runspaces

PowerShell 5.0 includes several cmdlets related to runspace debugging. These cmdlets allow you to debug arbitrary runspaces, that is, runspaces other than the default PowerShell console or PowerShell ISE.

The examples shown in this section assume the following setup. Adjust the examples for your particular setup:

- You are using IDM 5.5.1.3 and version 1.4.4.0 of the PowerShell connector.
- IDM is running on a local UNIX host, distinct from the Windows host on which the PowerShell connector runs.
- You have already installed and configured version 1.5.4.0 of the .NET connector server on the remote Windows host. You have also installed and tested the PowerShell connector. See "Setting Up the PowerShell Connector" for more information.
- The remote Windows host includes the PowerShell module version 5.0 (available with the Windows Management Framework 5.0).
- You are using the PowerShell scripts and configuration provided with the sample described in "Connecting to Azure AD With the PowerShell Connector" in the Samples Guide.

Before you start, check that the interpreters pool is configured as follows in your PowerShell connector configuration (provisioner.openicf-azureadpowershell.json):

```
"configurationProperties" : {
...

"UseInterpretersPool" : true,

"MinInterpretersPoolSize" : 1,

"MaxInterpretersPoolSize" : 1,
...
},
```

This configuration will make debugging easier.

Then follow these steps to set up debugging:

- 1. Connect the PowerShell ISE to the connector server.
  - Start the PowerShell ISE in Administrator mode.
  - b. From the PowerShell ISE, open the AzureADSearch.ps1 sample script:

```
Administrator: Windows PowerShell ISE
File Edit View Tools Debug Add-ons Help
   AzureADSearch.ps1 X
  98
  99
          $Connector.Result.Process($result)
      13
 100
 101
 102 ⊡filter Process-Users {
          $result = @{"__UID__" = $_.ObjectId.ToString(); "__NAME__"= $_.UserPrincipalName}
 103
 104
 105
          foreach($attrName in $Connector.Options.AttributesToGet)
 106 🚊
                 if ($_.$attrName -ne $null)
 107
 108
 109
                     $value = $_.$attrName
                     if ($value.GetType().Name.Contains("List"))
 110
 111 🖹
 112
                         smulti = a()
                         foreach($e in $value)
 113
 114 📥
                            $multi += $e
 115
 116
                         $result.Add($attrName, $multi)
 117
 118
 119
                     else
 120 😑
 121
                         $result.Add($attrName, $_.$attrName.ToString())
                     }
 122
                                                                                               >
 PS C:\Users\Administrator>
```

c. In the PowerShell ISE console, use the <a href="Get-Process">Get-Process</a> cmdlet to obtain the process identifier of the Connector Server service:

```
PS C:\Program Files (x86)\ForgeRock\OpenICF> Get-Process -Name "connector*"

Handles NPM(K) PM(K) WS(K) CPU(s) Id SI ProcessName

576 56 79748 89484 1.16 1628 1 ConnectorServerService
```

d. Use the <a href="EnterPSHostProcess">EnterPSHostProcess</a> cmdlet to connect to the Connector Server service, specifying its process identifier:

```
PS C:\Program Files (x86)\ForgeRock\OpenICF> Enter-PSHostProcess -Id 1628

[Process:1628]: PS C:\Program Files (x86)\ForgeRock\OpenICF>
```

e. Use the Get-Runspace to look at the PowerShell interpreter pool that is embedded by the connector:

Note that there is one Runspace (Runspace1) open. Because you have set the maximum pool size to 1, that number should not increase.

- 2. Enter Debug mode and call a script:
  - a. First, use the Debug-RunSpace cmdlet to attach to the available Runspace:

```
[Process:1628]: PS C:\Program Files (x86)\ForgeRock\OpenICF> Debug-Runspace -Id 1
Debugging Runspace: Runspace1
To end the debugging session type the 'Detach' command at the debugger prompt, or type 'Ctrl+C' otherwise.
```

b. Run any action over the IDM REST interface.

The following example queries all user accounts:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request GET \
"http://localhost:8080/openidm/system/azureadpowershell/account?_queryFilter=true"
Stopped at: $proceed = $TRUE
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>>
```

The output indicates that the debugger has been triggered and that it is stopped at the first line of code.

c. Type h to list the debugging commands:

```
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>> h
                     Single step (step into functions, scripts, etc.)
 s, stepInto
 v, step0ver
                     Step to next statement (step over functions, scripts, etc.)
o, stepOut
                     Step out of the current function, script, etc.
 c, continue
                     Continue operation
 q, quit
                     Stop operation and exit the debugger
 d, detach
                     Continue operation and detach the debugger.
 k, Get-PSCallStack Display call stack
 l, list
                     List source code for the current script.
                     Use "list" to start from the current line, "list <m>"
                     to start from line <m>, and "list <m> <n>" to list <n>
                     lines starting from line <m>
                     Repeat last command if it was stepInto, stepOver or list
 <enter>
 ?. h
                     displays this help message.
For instructions about how to customize your debugger prompt, type "help about prompt".
```

d. To inspect the variables injected into the scripts by the connector, type \$Connector:

e. Because the \$Connector variable is a hash table, you can use dotted notation to inspect the various items.

The following example inspects the connector configuration:

```
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>> $Connector
.Configuration
AuthenticateScriptFileName
                                  : C:/openidm/samples/scripted-powershell-with-ad/tools/

                                  : Org.IdentityConnectors.Common.Security.GuardedString
MinInterpretersPoolSize
                                  : 1
                                  : 1
MaxInterpretersPoolSize
```

#### The following example inspects the Search guery:

3. Use the s and v commands to step over and step into your scripts:

```
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>> s

Stopped at: $searchBase = $Connector.Configuration.PropertyBag.baseContext
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>> v

Stopped at: $attrsToGet = "*"
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>>
```

#### Note

You cannot use breakpoints with the debugger because it is running in memory.

4. Use the 1 command to check where you are in the script:

```
[DBG]: [Process:1628]: [Runspace1]: PS C:\Program Files (x86)\ForgeRock\OpenICF>> 1
   78:
  79: # Always put code in try/catch statement and make sure exceptions are re-thrown to connector
   80: try
  81: {
   82:
        $searchBase = $Connector.Configuration.PropertyBag.baseContext
  83:*
        $attrsToGet = "*"
         $filter = "*"
  84:
  85:
  86:
         if ( $Connector.Query ) {$filter = $Connector.Query}
   87:
         switch ($Connector.ObjectClass.Type)
  88:
  89:
          " ACCOUNT "
  90:
  91:
  92:
           Get-ADUser -Filter $filter -SearchBase $searchBase -Properties $attrsToGet | Process-
Results
   93.
          }
```

#### 5. Close the session.

When the script has completed, you will see the following message in the debugger console:

```
Command or script completed.
To end the debugging session type the 'Detach' command at the debugger prompt, or type 'Ctrl+C' otherwise.
```

Type Ctrl+C to return to the process prompt or exit to exit the process and return to the console prompt.

To debug the same script again, or to debug another script, you must call <a href="Debug-Runspace">Debug-Runspace</a> again before you send the query over the IDM REST interface.

# Groovy Connector Toolkit

OpenICF provides a generic Groovy Connector Toolkit that enables you to run a Groovy script for any OpenICF operation, such as search, update, create, and others, on any external resource.

The Groovy Connector Toolkit is not a complete connector in the traditional sense. Rather, it is a framework within which you must write your own Groovy scripts to address the requirements of your implementation.

# 6.1. Configuring Scripted Groovy Connectors

The Groovy Connector Toolkit is bundled in the JAR openidm/connectors/groovy-connector-1.4.4.0.jar.

A number of sample scripted connector implementations are provided in the Samples Guide, specifically in "Connecting to DS With ScriptedREST" in the Samples Guide, and "Connecting to DS With ScriptedCREST" in the Samples Guide. The scripts provided with these samples demonstrate how the Groovy Connector Toolkit can be used. These scripts cannot be used as is in your deployment, but are a good starting point on which to base your customization. For information about writing your own scripts, see "Writing Scripted Connectors With the Groovy Connector Toolkit" in the Connector Developer's Guide.

You specify the connector configuration in your project's <code>conf/provisioner.openicf-connector.json</code> file. A number of sample configurations for scripted Groovy implementations are provided in <code>openidm/samples/example-configurations/provisioners/provisioner.openicf-scriptedimpementation.json</code>. Use these as the basis for configuring your own scripted connector.

## 6.1.1. Validating Pooled Connections

The scripted SQL connector uses the Tomcat JDBC Connection Pool to managed its connections. Occasionally, a JDBC resource that is accessed by the scripted SQL connector might become unavailable for a period. When the resource comes back online, IDM is generally able to recover automatically and resume operations. However, the connector might not be able to refresh its connection pool and might then pass a closed connection to its scripts. This can affect operations until IDM is restarted.

To avoid this situation, you can configure *connection validation*, where connections are validated before being borrowed from the connection pool.

To configure connection validation, add the following properties to the configurationProperties object in your connector configuration:

#### testOnBorrow

Validates the connection object before it is borrowed from the pool. If the object fails to validate, it is dropped from the pool and the connector attempts to borrow another object.

For this property to have an effect, you must set validationQuery to a non-null string.

#### validationQuery

The SQL query used to validate connections from the pool before returning them to the caller.

The precise query will differ, depending on the database that you are accessing. The following list provides sample queries for common databases:

#### HyperSQL DataBase (HSQLDB)

```
select 1 from INFORMATION SCHEMA.SYSTEM USERS
```

#### **Oracle DB**

select 1 from dual

#### DB<sub>2</sub>

select 1 from sysibm.sysdummy1

#### MySQL

select 1

#### MS SQL

select 1

#### **PostgreSQL**

select 1

#### **Ingres Database**

select 1

#### **Apache Derby**

values 1

#### **H2 Database**

select 1

#### Firebird SQL

select 1 from rdb\$database

#### validationInterval

Specifies the maximum frequency (in milliseconds) at which validation is run. If a connection is due for validation but was previously validated within this interval, it is not validated again.

The larger this value, the better the connector performance. However, with a large value you increase the chance of a stale connection being presented to the connector.

Connection validation can have an impact on performance and should not be done too frequently. With the following configuration, connections are validated no more than every 34 seconds:

```
{
   "name" : "scriptedsql",
   ...
   "configurationProperties" : {
    ...
    "testOnBorrow" : true,
    "validationQuery" : "select 1 from dual",
    "validationInterval" : 34000,
```

# 6.2. Implemented Interfaces

The following tables list the OpenICF interfaces that are implemented for each scripted connector implementation:

### 6.2.1. OpenICF Interfaces Implemented by the Scripted Groovy Connector

The Scripted Groovy Connector implements the following OpenICF interfaces.

#### **Authenticate**

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### **Delete**

Deletes an object, referenced by its uid.

#### Resolve Username

Resolves an object by its username and returns the uid of the object.

#### **Schema**

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### Sync

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

### 6.2.2. OpenICF Interfaces Implemented by the Scripted CREST Connector

The Scripted CREST Connector implements the following OpenICF interfaces.

#### **Authenticate**

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### Script on Resource

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

### 6.2.3. OpenICF Interfaces Implemented by the Scripted Poolable Groovy Connector

The Scripted Poolable Groovy Connector implements the following OpenICF interfaces.

#### **Authenticate**

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### Resolve Username

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a **connector** variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

### 6.2.4. OpenICF Interfaces Implemented by the Scripted REST Connector

The Scripted REST Connector implements the following OpenICF interfaces.

#### **Authenticate**

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

## 6.2.5. OpenICF Interfaces Implemented by the Scripted SQL Connector

The Scripted SOL Connector implements the following OpenICF interfaces.

#### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### Resolve Username

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

# 6.3. Configuration Properties

The following tables list the configuration properties for each scripted connector implementation:

### 6.3.1. Scripted Groovy Connector Configuration

The Scripted Groovy Connector has the following configurable properties.

## 6.3.1.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
customSensitiveConfiguration	GuardedString	null	Yes	No		
Custom Sensitive Configuration script for Groovy ConfigSlurper						
customConfiguration	String	null		No		
Custom Configuration script for Groovy ConfigSlurper						

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 6.3.1.2. Operation Script Files Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
createScriptFileName	String	null		Create		
The name of the file used to perform the CREATE operation.						
customizerScriptFileName	String	null		No		
The script used to customize some	function of the conn	ector. Read the do	cumentation for mo	re details.		
authenticateScriptFileName	String	null		Authenticate		
The name of the file used to perform	n the AUTHENTICA	TE operation.				
scriptOnResourceScriptFileName	String	null		Script On Resource		
The name of the file used to perform the RUNSCRIPTONRESOURCE operation.						
deleteScriptFileName	String	null		Delete		

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
The name of the file used to per	rform the DELETE o	operation.		
resolveUsernameScriptFileName	String	null		Resolve Username
The name of the file used to per	rform the RESOLVE	_USERNAME ope	ration.	
searchScriptFileName	String	null		Get Search
The name of the file used to per	rform the SEARCH	operation.		
updateScriptFileName	String	null		Update
The name of the file used to per	rform the UPDATE	operation.		
schemaScriptFileName	String	null		Schema
The name of the file used to per	rform the SCHEMA	operation.		
testScriptFileName	String	null		Test
The name of the file used to per	rform the TEST ope	ration.		
syncScriptFileName	String	null		Sync
The name of the file used to per	rform the SYNC ope	eration.		

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

# 6.3.1.3. Groovy Engine configuration Properties

Property	Type	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
targetDirectory	File	null		No
Directory into which to write class	ses.			
warningLevel	int	1		No
Warning Level of the compiler				
scriptExtensions	String[]	['groovy']		No
Description is not available				
minimumRecompilationInterval	int	100		No
Sets the minimum of time after a	script can be rec	ompiled.		
scriptBaseClass	String	null		No
Base class name for scripts (must	derive from Scri	pt)		

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>			
scriptRoots	String[]	null		Yes			
The root folder to load the scripts from. If the value is null or empty the classpath value is used.							
tolerance	int	10		No			
The error tolerance, which is the number of non-fatal errors (per unit) that should be tolerated before compilation is aborted.							
debug	boolean	false		No			
If true, debugging code should be ac	tivated						
classpath	String[]	П		No			
Classpath for use during compilation	1.						
disabledGlobalASTTransformations	String[]	null		No			
Sets a list of global AST transformat org.codehaus.groovy.transform.AST				in META-INF/			
verbose	boolean	false		No			
If true, the compiler should produce	action information						
sourceEncoding	String	UTF-8		No			
Encoding for source files							
recompileGroovySource	boolean	false		No			
If set to true recompilation is enable	d						

a Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

# 6.3.2. Scripted CREST Connector Configuration

The Scripted CREST Connector has the following configurable properties.

# 6.3.2.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
customSensitiveConfiguration	GuardedString	null	Yes	No

The default TransactionIsolation READ_COMMITTED, READ_UN not be called and it defaults to t	COMMITTED, REP			
umTestsPerEvictionRun	int	0		No
Property not used in tomcat-jdb	c-pool.			
rl	String	null		No

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
test0nBorrow	boolean	false		No

The indication of whether objects will be validated before being borrowed from the pool. If the object fails to validate, it will be dropped from the pool, and we will attempt to borrow another. NOTE - for a true value to have any effect, the validationQuery parameter must be set to a non-null string. In order to have a more efficient validation, see validationInterval. Default value is false

fairQueue boolean true No

Set to true if you wish that calls to getConnection should be treated fairly in a true FIFO fashion. This uses the org.apache.tomcat.jdbc.pool.FairBlockingQueue implementation for the list of the idle connections. The default value is true. This flag is required when you want to use asynchronous connection retrieval. Setting this flag ensures that threads receive connections in the order they arrive. During performance tests, there is a very large difference in how locks and lock waiting is implemented. When fairQueue=true there is a decision making process based on what operating system the system is running. If the system is running on Linux (property os.name=Linux. To disable this Linux specific behavior and still use the fair queue, simply add the property org.apache.tomcat.jdbc.pool.FairBlockingQueue.ignoreOS=true to your system properties before the connection pool classes are loaded.

#### accessToUnderlyingConnectionAllowed boolean

true

Nο

Property not used. Access can be achieved by calling unwrap on the pooled connection. see javax.sql.DataSource interface, or call getConnection through reflection or cast the object as javax.sql.PooledConnection

maxAge

0

Nο

Time in milliseconds to keep this connection. When a connection is returned to the pool, the pool will check to see if the now - time-when-connected > maxAge has been reached, and if so, it closes the connection rather than returning it to the pool. The default value is 0, which implies that connections will be left open and no age check will be done upon returning the connection to the pool.

#### minEvictableIdleTimeMillis

int

lona

60000

No

The minimum amount of time an object may sit idle in the pool before it is eligible for eviction. The default value is 60000 (60 seconds).

#### timeBetweenEvictionRunsMillis

int

5000

No

The number of milliseconds to sleep between runs of the idle connection validation/cleaner thread. This value should not be set under 1 second. It dictates how often we check for idle, abandoned connections, and how often we validate idle connections. The default value is 5000 (5 seconds).

testOnReturn

boolean

boolean

false

No

The indication of whether objects will be validated before being returned to the pool. NOTE - for a true value to have any effect, the validationQuery parameter must be set to a non-null string. The default value is false.

useLock

Description is not available

maxActive int

false

100

No

No

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
The maximum number of active connections that can be allocated from this pool at the same time. The default value is $100$					
username	String	null		No	
The connection username to be pass DataSource.getConnection(usernam will use the ones configured here. Se	e,password) by defa	ault will not use cr	edentials passed in		

a Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 6.3.5. Scripted Poolable Groovy Connector Configuration

The Scripted Poolable Groovy Connector has the following configurable properties.

## 6.3.5.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
customSensitiveConfiguration	GuardedString	null	Yes	No
Custom Sensitive Configuration scri	pt for Groovy Confi	gSlurper		
customConfiguration	String	null		No
Custom Configuration script for Gro	ovy ConfigSlurper			

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 6.3.5.2. Operation Script Files Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
createScriptFileName	String	null		Create
The name of the file used to perform	n the CREATE opera	ation.		
customizerScriptFileName	String	null		No
The script used to customize some t	function of the conn	ector. Read the do	cumentation for mo	re details.
authenticateScriptFileName	String	null		Authenticate
The name of the file used to perform	n the AUTHENTICA	TE operation.		
scriptOnResourceScriptFileName	String	null		Script On Resource
The name of the file used to perform	□ n the RUNSCRIPTO	⊥ NRESOURCE opei	ration	

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
deleteScriptFileName	String	null		Delete
The name of the file used to perform	m the DELETE oper	ation.		
resolveUsernameScriptFileName	String	null		Resolve Username
The name of the file used to perform	m the RESOLVE_US	ERNAME operation	n.	
searchScriptFileName	String	null		Get Search
The name of the file used to perform	m the SEARCH oper	ration.		
updateScriptFileName	String	null		Update
The name of the file used to perform	m the UPDATE oper	ation.		
schemaScriptFileName	String	null		Schema
The name of the file used to perform	m the SCHEMA ope	ration.		
testScriptFileName	String	null		Test
The name of the file used to perform	m the TEST operation	on.		
syncScriptFileName	String	null		Sync
The name of the file used to perform	m the SYNC operation	on.		

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 6.3.5.3. Groovy Engine configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
targetDirectory	File	null		No
Directory into which to write classe	s.			
warningLevel	int	1		No
Warning Level of the compiler				
scriptExtensions	String[]	['groovy']		No
Description is not available				
minimumRecompilationInterval	int	100		No
Sets the minimum of time after a so	ript can be recompi	led.		
scriptBaseClass	String	null		No

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
Base class name for scripts (must d	erive from Script)			
scriptRoots	String[]	null		Yes
The root folder to load the scripts fi	com. If the value is	null or empty the c	lasspath value is us	sed.
tolerance	int	10		No
The error tolerance, which is the nucompilation is aborted.	imber of non-fatal	errors (per unit) tha	nt should be tolerat	ed before
debug	boolean	false		No
If true, debugging code should be a	ctivated			
classpath	String[]	П		No
Classpath for use during compilation	n.			
disabledGlobalASTTransformations	String[]	null		No
Sets a list of global AST transforma org.codehaus.groovy.transform.AST				in META-INF,
verbose	boolean	false		No
If true, the compiler should produce	e action informatio	n		
sourceEncoding	String	UTF-8		No
Encoding for source files				
recompileGroovySource	boolean	false		No

a Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

# 6.4. Debugging Scripts Called From the Groovy Connector

When you call a Groovy script from the Groovy connector, you can use the SLF4J logging facility to obtain debug information.

For instructions on how to use this facility, see the KnowledgeBase article  $How\ do\ I\ add\ logging\ to\ Groovy\ scripts\ in\ IDM.$ 

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# Chapter 7 SAP Connector

The SAP connector is an implementation of the Scripted Groovy Connector Toolkit that connects to any SAP system using the SAP JCo Java libraries. This chapter describes how to install and configure the scripted SAP connector, and how to test the sample scripts that are bundled with the connector.

The sample scripts illustrate the following scenarios:

- · Synchronization of users between an SAP HR module and IDM
- Synchronization of users between IDM and an SAP (R/3) system

## 7.1. Before You Start

The SAP connector requires the SAP Java Connector (JCo) libraries, version 3.0.12 or later. ForgeRock distributes the SAP connector without these JCo libraries. Before you can use the SAP connector, you must obtain the JCo libraries that correspond to your architecture.

# 7.2. Setting Up the SAP Connector

- 1. Download the SAP connector from ForgeRock's BackStage site.
- 2. Copy the SAP connector JAR file (sap-connector-1.4.2.0.jar) to the openidm/connectors directory:

```
$ cp ~/Downloads/sap-connector-1.4.2.0.jar /path/to/openidm/connectors
```

 Copy the SAP JCo libraries that correspond to your architecture to the /path/to/openidm/lib directory. For example:

```
$ cp sapjco3.jar /path/to/openidm/lib
$ cp libsapjco3.so /path/to/openidm/lib
```

4. Change your IDM logging configuration to log messages from the SAP connector.

By default, IDM logs nothing for the SAP connector. To troubleshoot any issues with the connector, set the following properties in your project's conf/logging.properties file:

```
# SAP Connector Logging
org.forgerock.openicf.connectors.sap.level=FINER
samples.r3.level=FINER
samples.hr.level=FINER
samples.level=FINER
```

# 7.3. Using the SAP Connector With an SAP HR System

The SAP HR sample scripts enable you to manage the email address and global employee UID of records in an SAP HR system.

The following sections explain how to configure IDM to use these sample scripts, how to test the connection to the SAP HR system, and how to update user records.

## 7.3.1. Setting up IDM for the SAP HR Samples

 Create a connector configuration file for the SAP connector and place it in your project's conf/ directory.

You can use this sample provisioner.openicf-saphr.json as a guide.

Edit that file with the connection details for your SAP HR system. Specifically, set at least the following properties:

#### destination

An alias to the SAP system to which you are connecting, for example, SAP1. If you are connecting to more than one SAP system, the destination property for each system must be unique.

The sample connector configuration assumes a connection to a single SAP system, so the value for this property in the sample configuration is OPENIDM.

#### asHost

The FQDN of your SAP Application Server, for example sap.example.com.

#### user

Your SAP user account.

#### password

The password of this SAP user account.

#### client

The SAP Client number that will be used to connect to the SAP system.

#### systemNumber

The SAP system number.

#### directConnection

A boolean (true/false). If true, the connection goes directly to an SAP ABAP Application server or SAP router. If false, the connection goes to a group of SAP instances, through an SAP message server.

#### sapRouter

The IP address and port of the SAP router, if applicable. The syntax is /H/host[/S/port], for example /H/203.0.113.0/S/3299.

#### poolCapacity

The maximum number of idle connections kept open by the destination. If there is no connection pooling, set this to 0. The default value is 1.

For optimum performance, set this value to an integer between 5 and 10.

2. To test this connector, you can use the sample Groovy scripts available from the *ForgeRock Artifact Repository Browser*. You can find the source for these scripts in this location, in the samples/ directory, as well as the samples/hr/ subdirectory.

```
TestSAP.groovy
SearchSAPHR.groovy
UpdateSAPHR.groovy
SchemaSAPHR.groovy
EmplComm.groovy
```

Update your connector configuration to point to those scripts. The sample connector configuration assumes the following locations for the scripts (relative to the value of the scriptRoots property):

```
"testScriptFileName" : "samples/TestSAP.groovy",
"searchScriptFileName" : "samples/hr/SearchSAPHR.groovy",
"updateScriptFileName" : "samples/hr/UpdateSAPHR.groovy",
"schemaScriptFileName" : "samples/hr/SchemaSAPHR.groovy",
```

The EmplComm.groovy must be placed in the same location as the Search, Update, and Schema scripts.

#### **Important**

The Groovy scripts belong to a specific package. The parent directory where the scripts are located must be the same as the package name. So the TestSAP.groovy script must be under a samples directory (because

it belongs to the samples package) and the remaining HR scripts must be under a samples/hr directory (because they belong to the hr package).

## 7.3.2. Testing the Connection to the SAP HR System

1. Start IDM with the configuration for your SAP connector project.

This procedure assumes that the configuration is in the default path/to/openidm directory. If your SAP project is in a different directory, use the -p option with the startup command to point to that directory.

```
$ cd path/to/openidm
$ ./startup.sh
```

2. Test that the connector has been configured correctly and that the SAP HR system can be reached:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request POST \
 "http://localhost:8080/openidm/system/saphr/?_action=test"
{
  "name" : "saphr",
  "enabled" : true,
  "config" : "config/provisioner.openicf/saphr2",
  "objectTypes" : [ "__ALL__", "employee" ],
  "connectorRef" : {
    "connectorName": "org.forgerock.openicf.connectors.sap.SapConnector",
    "bundleName" : "org.forgerock.openicf.connectors.sap-connector",
    "bundleVersion": "1.4.2.0"
  "displayName" : "Sap Connector",
  "ok" : true
}
```

3. Retrieve a list of the existing users (with their employee number) in the SAP HR system:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request GET \
"http://localhost:8080/openidm/system/saphr/employee?_queryId=query-all-ids"
{
    "result" : [ {
        "_id" : "00000010",
        "_NAME__" : "00000010"
}, {
        "_id" : "00000069",
        "_NAME__" : "00000069"
}, {
        "_id" : "00000070",
        "_id" : "000000070",
        "_NAME__" : "000000070"
}
```

4. Retrieve the complete record of an employee in the SAP HR system by including the employee's ID in the URL.

The following command retrieves the record for employee Maria Gonzales:

```
--header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request GET \
 "http://localhost:8080/openidm/system/saphr/employee/55099307"
{
  " id" : "55099307",
  "PERSONAL DATA" : {
    "PERNO" : "55099307",
    "INFOTYPE" : "0002",
    "TO DATE" : "Fri Dec 31 00:00:00 CET 9999",
    "FROM DATE" : "Tue Mar 30 00:00:00 CET 1954",
    "SEQNO": "000",
    "CH ON" : "Thu Mar 27 00:00:00 CET 2003",
    "CHANGED BY" : "MAYROCK",
    "LAST_NAME" : "Gonzales",
    "FIRSTNAME" : "Maria",
    "NAME FORM" : "00",
    "FORMOFADR" : "2",
    "GENDER" : "2"
    "BIRTHDATE" : "Tue Mar 30 00:00:00 CET 1954",
    "LANGU" : "D",
    "NO O CHLDR" : "0",
    "BIRTHYEAR" : "1954".
    "BIRTHMONTH" : "03",
    "BIRTHDAY" : "30".
    "LASTNAME M" : "GONZALES",
    "FSTNAME M" : "MARIA"
 }
}
```

## 7.3.3. Using the SAP Connector to Manage Employee Information (SAP HR)

The following sample commands show how the SAP connector is used to manage the email account of user Maria Gonzales, retrieved in the previous step. Management of the global UID (SYS-UNAME) works in the same way.

 Check if Maria Gonzales already has an email account on the SAP HR system by filtering a query on her user account for the EMAIL field:

```
$ curl \
    --header "X-OpenIDM-Username: openidm-admin" \
    --header "X-OpenIDM-Password: openidm-admin" \
    --request GET \
    "http://localhost:8080/openidm/system/saphr/employee/55099307?_fields=EMAIL"
    {
        "_id" : "55099307",
}
```

No email account is found for Maria Gonzales.

2. Add an email account by sending a PUT request. The JSON payload should include the email address as the value of the ID property:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request PUT \
--data '{
 "EMAIL": { "ID": "maria.gonzales@example.com" }
"http://localhost:8080/openidm/system/saphr/employee/55099307"
  " id" : "55099307",
 "EMAIL" : [ {
    "EMPLOYEENO" : "55099307".
    "SUBTYPE" : "0010",
    "VALIDEND" : "Fri Dec 31 00:00:00 CET 9999",
    "VALIDBEGIN": "Fri March 18 00:00:00 CET 2016",
    "RECORDNR" : "000"
    "COMMTYPE" : "0010"
    "NAMEOFCOMMTYPE" : "E-mail",
    "ID" : "Maria.Gonzales@example.com"
 } ]
```

By default, the connector sets the VALIDBEGIN date to the current date, and the VALIDEND date to the SAP "END" date (12/31/9999). You can specify different temporal constraints by including these properties in the JSON payload, with the format YYYYMMDD. For example:

```
{
   "EMAIL": {
     "ID": "maria.gonzales@example.com"
     "VALIDBEGIN": "20160401",
     "VALIDEND": "20161231"
   }
}
```

3. To change the value of an existing email account, provide a new value for the ID.

The JSON payload of the change request must also include the RECORDNR attribute, as well as the VALIDEEGIN and VALIDEND dates, in SAP format (YYYYMMDD).

The following example changes Maria Gonzales' email address to maria.gonzales-admin@example.com:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request PUT \
--data '{
    "EMAIL": {
        "ID": "maria.gonzales-admin@example.com",
        "RECORDNR": "000",
        "VALIDEND": "99991231",
        "VALIDBEGIN": "20000101"
    }
}' \
"http://localhost:8080/openidm/system/saphr/employee/55099307"
```

4. To change the temporal constraint (VALIDEND date) of the record, include the existing VALIDEND data in the JSON payload, and specify the new end date as a value of the DELIMIT DATE attribute.

The following example changes the end date of Maria Gonzale's new mail address to December 31st, 2016:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request PUT \
--data '{
    "EMAIL": {
        "ID": "maria.gonzales-admin@example.com",
            "RECORDNR": "000",
            "VALIDEND": "99991231",
            "VALIDBEGIN": "20000101",
            "DELIMIT_DATE": "20161231"
    }
}' \
"http://localhost:8080/openidm/system/saphr/employee/55099307"
```

5. To delete the email address of the record, send a PUT request with the current RECORDNR, VALIDBEGIN, and VALIDEND attributes, but without the ID.

The following request removes the email address from Maria Gonzales' record:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request PUT \
--data '{
    "EMAIL": {
        "RECORDNR" : "000",
        "VALIDEND" : "99991231",
        "VALIDBEGIN" : "20000101"
    }
}' \
"http://localhost:8080/openidm/system/saphr/employee/55099307"
```

# 7.4. Using the SAP Connector to Manage SAP Basis System (R/3) Users

The SAP Connector enables you to perform the following operations on SAP system user accounts:

- · List all users
- List all activity groups (roles)
- · Manage user profiles
- List all user companies
- · Obtain a user's details
- · Create a user
- Update a user
- Assign roles to a user
- · Lock a user account
- · Unlock a user account
- · Delete a user account

Currently, the SAP connector cannot detect changes on the SAP system in real time. You must run a reconciliation operation to detect changes on the SAP system.

## 7.4.1. Setting up IDM for the SAP R/3 Samples

 Create a connector configuration file for the SAP connector and place it in your project's conf/ directory.

You can use this sample provisioner.openicf-sapr3.json as a guide.

Edit that file with the connection details for your SAP R/3 system. Specifically, set at least the following properties:

#### destination

An alias to the SAP system to which you are connecting, for example, SAP1. If you are connecting to more than one SAP system, the destination property for each system must be unique.

The sample connector configuration assumes a connection to a single SAP system, MYSAP.

#### asHost

The FQDN of your SAP Application Server, for example sap.example.com.

#### user

Your SAP user account.

#### password

The password of this SAP user account.

#### client

The SAP Client number that will be used to connect to the SAP system.

#### systemNumber

The SAP system number.

#### directConnection

A boolean (true/false). If true, the connection goes directly to an SAP ABAP Application server or SAP router. If false, the connection goes to a group of SAP instances, through an SAP message server.

#### sapRouter

The IP address and port of the SAP router, if applicable. The syntax is /H/host[/S/port], for example /H/203.0.113.0/S/3299.

#### poolCapacity

The maximum number of idle connections kept open by the destination. If there is no connection pooling, set this to 0. The default value is 1.

For optimum performance, set this value to an integer between 5 and 10.

2. To test this connector, you can use the sample Groovy scripts available from the *ForgeRock Artifact Repository Browser*. You can find the source for these scripts in this location, in the samples/ directory, as well as the samples/r3/ subdirectory.

```
TestSAP.groovy
SearchSAPR3.groovy
CreateSAPR3.groovy
UpdateSAPR3.groovy
DeleteSAPR3.groovy
SchemaSAPR3.groovy
```

Update your connector configuration to point to those scripts. The sample connector configuration assumes the following locations for the scripts (relative to the value of the scriptRoots property):

```
"testScriptFileName" : "samples/TestSAP.groovy",
"searchScriptFileName" : "samples/r3/SearchSAPR3.groovy",
"createScriptFileName" : "samples/r3/CreateSAPR3.groovy",
"updateScriptFileName" : "samples/r3/UpdateSAPR3.groovy",
"deleteScriptFileName" : "samples/r3/DeleteSAPR3.groovy",
"schemaScriptFileName" : "samples/r3/SchemaSAPR3.groovy",
```

#### **Important**

The Groovy scripts belong to a specific package. The parent directory where the scripts are located must be the same as the package name. So the TestSAP.groovy script must be under a samples directory (because it belongs to the samples package) and the R/3 scripts must be under a samples/r3 directory (because they belong to the r3 package).

## 7.4.2. Testing the Connection to the SAP R/3 System

1. Start IDM with the configuration for your SAP R/3 project.

This procedure assumes that the configuration is in the default path/to/openidm directory. If your SAP project is in a different directory, use the -p option with the startup command to point to that directory.

```
$ cd path/to/openidm
$ ./startup.sh
```

2. Test that the connector has been configured correctly and that the SAP R/3 system can be reached:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request POST \
 "http://localhost:8080/openidm/system/mysap/?_action=test"
  "name": "mysap",
  "enabled": true,
  "config": "config/provisioner.openicf/mysap",
  "objectTypes": [
    "__ALL__",
    "user",
    "activity group",
    "company",
    "profile"
 ],
  "connectorRef": {
    "connectorName": "org.forgerock.openicf.connectors.sap.SapConnector",
    "bundleName": "org.forgerock.openicf.connectors.sap-connector",
    "bundleVersion": "1.4.2.0"
  "displayName": "Sap Connector",
  "ok": true
}
```

## 7.4.3. Using the SAP Connector to Manage SAP R/3 Users

This section provides sample commands for managing users in an SAP system.

## 7.4.3.1. Listing the Users in the SAP System

The following command returns a list of the existing users in the SAP system, with their IDs:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request GET \
 "http://localhost:8080/openidm/system/mysap/user?_queryId=query-all-ids"
  "result": [
    {
      " id": "BJENSEN",
        NAME ": "BJENSEN"
    {
        id": "DDIC",
         NAME _": "DDIC"
    },
      " id": "USER4"
        NAME ": "USER4"
    },
      " id": "USER6",
```

```
"__NAME__": "USER6"
},
{
    "_id": "USER7",
    "__NAME__": "USER7"
}

],
    "resultCount": 9,
    "pagedResultsCookie": null,
    "totalPagedResultsPolicy": "NONE",
    "totalPagedResults": -1,
    "remainingPagedResults": -1
}
```

## 7.4.3.2. Obtaining the Details of an SAP User

The following command uses the SAP connector to obtain a user's details from a target SAP system:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request GET \
 "http://localhost:8080/openidm/system/mysap/user/BJENSEN"
    "__NAME__": "BJENSEN",
"__ENABLE__": true,
    "__ENABLE_DATE__": "2015-09-01",
"__DISABLE_DATE__": "2016-09-01",
       _LOCK_OUT__": false,
    "ADDTEL": [
         {
              "COUNTRY": "DE",
              "TELEPHONE": "19851444",
         },
         . . .
    "PROFILES": [
         {
              "BAPIPROF": "T_ALM_CONF",
    "ISLOCKED": {
         "WRNG LOGON": "U",
    },
"ACTIVITYGROUPS": [
              "AGR_NAME": "MW_ADMIN", "FROM_DAT": "2015-07-15",
              "TO_DAT": "9999-12-31",
              "AGR_TEXT": "Middleware Administrator"
         },
    "DEFAULTS": {
```

```
"COMPANY": {
    "COMPANY": "SAP AG"
},
"ADDRESS": {
    ...
},
"UCLASS": {
    ...
},
"LASTMODIFIED": {
    "MODDATE": "2015-07-15",
    "MODTIME": "14:22:57"
},
"LOGONDATA": {
    "GLTGV": "2015-09-01",
    "GLTGB": "2016-09-01",
    ...
},
"_id": "BJENSEN"
}
```

In addition to the standard user attributes, the GET request returns the following OpenICF operational attributes:

- ENABLE indicates whether the account is enabled, based on the value of the LOGONDATA attribute
- ENABLE DATE set to the value of LOGONDATA/GLTGV (date from which the user account is valid)
- DISABLE DATE set to the value of LOGONDATA/GLTGB (date to which the user account is valid)
- LOCK OUT indicates whether the account is locked

## 7.4.3.3. Creating SAP User Accounts

To create a user, you must supply *at least* a username and password. If you do not provide a lastname, the connector uses the value of the username.

The following command creates a new SAP user, SCARTER:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request POST \
--data '{
    "__NAME__": "SCARTER",
    "__PASSWORD__": "Passw0rd"
}' \
"http://localhost:8080/openidm/system/mysap/user/?_action=create"
{
    "_id": "SCARTER",
    "COMPANY": {
        "COMPANY": "SAP AG"
```

```
LOCK OUT ": false,
  "ADDRESS": {
    NAME ": "SCARTER",
  "LASTMODIFIED": {
    "MODDATE": "2016-04-20",
    "MODTIME": "04:14:29"
  "UCLASS": {
    "COUNTRY SURCHARGE": "0"
    "SUBSTITUTE_FROM": "0000-00-00"
    "SUBSTITUTE UNTIL": "0000-00-00"
    ENABLE ": true,
  "DEFAULTS": {
    "SPDB": "H",
    "SPDA": "K",
    "DATFM": "1"
    "TIMEFM": "0"
  "LOGONDATA": {
  "ISLOCKED": {
    "WRNG_LOGON": "U",
    "LOCAL LOCK": "U",
    "GLOB_LOCK": "U"
    "NO USER PW": "U"
 }
}
```

The SAP account that is created is valid and enabled, but the password is expired by default. To log into the SAP system, the newly created user must first provide a new password.

To create a user with a valid (non-expired) password, include the <u>PASSWORD\_EXPIRED</u> attribute in the ISON payload, with a value of false. For example:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request POST \
--data '{
    "__NAME__": "SCARTER",
    "__PASSWORD__": "Passw0rd",
    "__PASSWORD_EXPIRED__": false
}' \
"http://localhost:8080/openidm/system/mysap/user/?_action=create"
```

To create an account that is locked by default, include the <u>LOCK\_OUT</u> attribute in the JSON payload, with a value of <u>true</u>. For example:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
```

```
--header "Content-Type: application/json" \
--request POST \
--data '{
           _" : "SCARTER",
     NAME
   ..-
     PASSWORD ": "Password",
  "_LOCK_OUT_": true
"http://localhost:8080/openidm/system/mysap/user/?_action=create"
   "__NAME__": "SCARTER",
"__ENABLE__": false,
"__LOCK_OUT__": true,
   "LOGONDATA": {
       "GLTGV": "0000-00-00",
       "GLTGB": "0000-00-00",
       "USTYP": "A",
       "LTIME": "00:00:00"
       "BCODE": "2FCOD86C99AA5862",
       "CODVN": "B",
       "PASSCODE": "1DBBD983287D7CB4D8177B4333F439F808A395FA",
       "CODVC": "F"
       "PWDSALTEDHASH": "{x-issha, 1024}zrs3Zm/fX/l/KFGATp3kvOGlis3zLLiPmPVCDpJ9XF0=",
       "CODVS": "I"
  "MODDATE": "2015-10-01",
       "MODTIME": "15:25:18"
  },
"ISLOCKED": {
       "WRNG LOGON": "U",
       "LOCAL LOCK": "L",
                               // "L" indicates that the user is locked on the local system
       "GLOB_LOCK": "U",
       "NO USER PW": "U"
   }
```

## 7.4.3.3.1. Schema Used by the SAP Connector For User Accounts

For the most part, the SAP connector uses the standard SAP schema to create a user account. The most common attributes in an SAP user account are as follows:

- ADDRESS user address data
- LOGONDATA user logon data
- DEFAULTS user account defaults
- COMPANY the company to which the user is assigned
- REF USER the usernames of the Reference User
- ALIAS an alias for the username
- UCLASS license-related user classification

- LASTMODIFIED read-only attribute that indicates the date and time that the account was last changed
- ISLOCKED read-only attribute that indicates the lockout status of the account
- IDENTITY assignment of a personal identity to the user account
- PROFILES any profiles assigned to the user account (see "Managing User Profiles").
- ACTIVITYGROUPS activity groups assigned to the user
- ADDTEL telephone numbers assigned to the user

In addition, the SAP connector supports the following OpenICF operational attributes for CREATE requests:

- LOCK OUT
- PASSWORD
- PASSWORD EXPIRED

The following example creates a user, KVAUGHAN, with all of the standard attributes:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --header "Content-Type: application/json" \
 --request POST \
 --data '{
    "__NAME__" : "KVAUGHAN",
"__PASSWORD__": "Passw0rd",
       PASSWORD EXPIRED ": false,
    "LOGONDATA": {
        "GLTGV": "2016-04-01",
        "GLTGB": "2016-12-01",
        "USTYP": "A"
    "ADDRESS": {
       "FIRSTNAME": "Katie"
       "LASTNAME": "Vaughan"
       "TEL1_NUMBR": "33297603177",
       "E_MAIL": "katie.vaughan@example.com",
       "FUNCTION": "Test User"
   ),
"COMPANY": {
        "COMPANY": "EXAMPLE.COM"
    "ALIAS": {
        "USERALIAS": "KVAUGHAN"
 "http://localhost:8080/openidm/system/mysap/user/?_action=create"
  " id": "KVAUGHAN".
  "ADDRESS": {
```

```
"PERS NO": "0000010923".
  "ADDR NO": "0000010765",
  "FIRSTNAME": "Katie",
  "LASTNAME": "Vaughan",
  "FULLNAME": "Katie Vaughan",
  "E MAIL": "katie.vaughan@example.com",
  "LANGU CR P": "E",
  "LANGUCPISO": "EN"
"LOGONDATA": {
  "GLTGV": "2016-04-01",
  "GLTGB": "2016-12-01",
"COMPANY": {
  "COMPANY": "SAP AG"
},
"_ENABLE__": true,
"ADDTEL": [
  {
"ISLOCKED": {
  "WRNG_LOGON": "U",
  "LOCAL_LOCK": "U",
  "GLOB_LOCK": "U",
  "NO USER PW": "U"
"UCLASS": {
  "COUNTRY SURCHARGE": "0",
  "SUBSTITUTE FROM": "0000-00-00"
  "SUBSTITUTE UNTIL": "0000-00-00"
},
"ALIAS": {
  "USERALIAS": "KVAUGHAN"
"__NAME__": "KVAUGHAN",
"__LOCK_OUT__": false,
"LASTMODIFIED": {
  "MODDATE": "2016-04-20",
  "MODTIME": "04:55:08"
"DEFAULTS": {
  "SPDB": "H",
  "SPDA": "K",
  "DATFM": "1"
  "TIMEFM": "0"
  _DISABLE_DATE__": "2016-12-01"
                                   // (Value of LOGONDATA/GLTGB)
```

# 7.4.3.4. Updating SAP User Accounts

The following sections provide sample commands for updating an existing user account.

## 7.4.3.4.1. Locking and Unlocking an Account

To lock or unlock a user's account, send a PUT request, and set the value of the user's <u>LOCK\_OUT\_</u> attribute to true.

The following example locks user KVAUGHAN's account:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--header "If-Match: *" \
--request PUT \
--data '{
    "_LOCK_OUT__": true
}' \
"http://localhost:8080/openidm/system/mysap/user/KVAUGHAN"
```

The following example unlocks KVAUGHAN's account:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--header "If-Match: *" \
--request PUT \
--data '{
    "__LOCK_OUT__": false
}' \
"http://localhost:8080/openidm/system/mysap/user/KVAUGHAN"
```

## 7.4.3.4.2. Updating the Standard Attributes of a User's Account

To update a user's standard attributes, send a PUT request to the user ID. The JSON payload must respect the structure for each attribute, as indicated in "Schema Used by the SAP Connector For User Accounts".

The following command updates the ADDRESS attribute of user KVAUGHAN:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--header "If-Match: *" \
--request PUT \
--data '{
    "ADDRESS": {
        "FIRSTNAME": "Katie"
        "LASTNAME": "Vaughan",
        "FULLNAME": "Katie Vaughan",
        "FUNCTION": "Administrator",
        "TITLE": "Company"
        "NAME": "EXAMPLE.COM"
        "CITY": "San Francisco",
        "POSTL COD1": "94105"
        "STREET": "Sacramento St",
        "HOUSE NO": "2912",
        "COUNTRY": "US",
        "COUNTRYISO": "US".
        "LANGU": "E",
        "LANGU ISO": "EN",
        "REGION": "CA",
        "TIME_ZONE": "PST"
        "TEL1 NUMBR": "33297603177",
        "E_MAIL": "katie.vaughan@example.com",
        "LANGU_CR_P": "E",
        "LANGUCPISO": "EN"
"http://localhost:8080/openidm/system/mysap/user/KVAUGHAN"
```

## 7.4.3.4.3. Resetting a User's Password

To reset the user's password, provide the new password as the value of the <u>\_\_PASSWORD\_\_</u> attribute, in a PUT request. The following command resets KVAUGHAN's password to <u>MyPasswOrd</u>:

Note that unless you set the <u>\_\_PASSWORD\_EXPIRED\_</u> attribute to false, the user will be required to reset her password the next time she logs into the SAP system.

The following command resets KVAUGHAN's password to MyPasswOrd, and ensures that she does not have to reset her password the next time she logs in:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request PUT \
--data '{
    "__PASSWORD__": "MyPassw0rd",
    "__PASSWORD_EXPIRED__": false
}'
"http://localhost:8080/openidm/system/mysap/user/KVAUGHAN"
```

## 7.4.3.5. Deleting User Accounts

To delete a user account, send a DELETE request to the user ID. The following example deletes KVAUGHAN:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request DELETE \
"http://localhost:8080/openidm/system/mysap/user/KVAUGHAN"
```

The command returns the complete user object that was deleted.

## 7.4.3.6. Managing User Profiles

An SAP system uses *profiles* to manage authorization. The following examples demonstrate how to add, change, and remove a user's profiles.

## 7.4.3.6.1. Creating a User With One or More Profiles

Profiles are added as an array of one or more objects.

The following command creates a user BJENSEN, with the system administrator profile (S A.SYSTEM):

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--request POST \
--data '{
   "__NAME__" : "BJENSEN",
   "_PASSWORD ": "Password",
   "_PASSWORD_EXPIRED__": false,
   "PROFILES": [
       {"BAPIPROF": "S_A.SYSTEM"}
"http://localhost:8080/openidm/system/mysap/user/?_action=create"
  " id": "BJENSEN".
 "COMPANY": {
    "COMPANY": "SAP AG"
 "PROFILES": [
   {
      "BAPIPROF": "S A.SYSTEM",
      "BAPIPTEXT": "System administrator (Superuser)",
      "BAPITYPE": "S",
      "BAPIAKTPS": "A"
   }
 ],
    NAME ": "BJENSEN"
```

Note that the additional information regarding that profile is added to the user account automatically.

## 7.4.3.6.2. Updating a User's Profiles

To update a user's profiles, send a PUT request to the user's ID, specifying the new profiles as an array of values for the PROFILES attribute. The values provided in the PUT request will replace the current profiles, so you must include the existing profiles in the request.

The following example adds the SAP ALL profile to user BJENSEN's account:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--header "Content-Type: application/json" \
--header "If-Match: *" \
--request PUT \
--data '{
    "PROFILES": [
        {"BAPIPROF": "S_A.SYSTEM"},
        {"BAPIPROF": "SAP_ALL"}
    ]
}' \
"http://localhost:8080/openidm/system/mysap/user/BJENSEN"
{
    "_id": "BJENSEN",
```

```
"COMPANY": {
  "COMPANY": "SAP AG"
"PROFILES": [
  {
    "BAPIPROF": "SAP ALL"
    "BAPIPTEXT": "All SAP System authorizations",
    "BAPITYPE": "C",
    "BAPIAKTPS": "A"
  },
    "BAPIPROF": "S A.SYSTEM",
    "BAPIPTEXT": "System administrator (Superuser)",
    "BAPITYPE": "S",
    "BAPIAKTPS": "A"
  }
],
   NAME ": "BJENSEN"
```

## 7.4.3.6.3. Removing All Profiles From a User Account

To remove all profiles from a user's account, update the account with an empty array. The following example removes all profiles from BJENSEN's account:

```
$ curl \
    --header "X-OpenIDM-Username: openidm-admin" \
    --header "X-OpenIDM-Password: openidm-admin" \
    --header "Content-Type: application/json" \
    --header "If-Match: *" \
    --request PUT \
    --data '{
        "PROFILES": []
}' \
    "http://localhost:8080/openidm/system/mysap/user/BJENSEN"

    "_id": "BJENSEN",
    "COMPANY": {
        "COMPANY": "SAP AG"
     },
     ...
     "__NAME__": "BJENSEN"
}
```

The output shows no PROFILES attribute, as this attribute is now empty for this user.

## 7.4.3.7. Managing User Roles

SAP user roles (or *activity groups*) are an alternative mechanism to grant authorization to an SAP system. Essentially, a role encapsulates a set of one or more profiles.

Roles can be granted with *temporal constraints*, that is, a period during which the role is valid. If no temporal constraints are specified, the SAP connector sets the FROM date to the current date and the TO date to 9999-12-31.

## 7.4.3.7.1. Creating a User With One or More Profiles

Roles are added as an array of one or more objects.

The following command creates a user SCARTER, with two roles: SAP\_AUDITOR\_SA\_CCM\_USR and SAP\_ALM\_ADMINISTRATOR. The auditor role has a temporal constraint, and is valid only from May 1st, 2016 to April 30th, 2017. The format of the temporal constraint is YYYY-mm-dd:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --header "Content-Type: application/json" \
 --request POST \
 --data {
    " NAME
    "__NAME__" : "SCARTER",
"__PASSWORD__": "Passw0rd",
       PASSWORD_EXPIRED__": false,
    "ACTIVITYGROUPS": [
        {
             "AGR_NAME": "SAP_AUDITOR_SA_CCM_USR",
             "FROM_DAT": "2016-05-01",
            "TO DAT": "2017-04-30"
        },
        {
            "AGR_NAME": "SAP_ALM_ADMINISTRATOR"
        }
    ]
 "http://localhost:8080/openidm/system/mysap/user/? action=create"
  " id": "SCARTER",
  "COMPANY": {
    "COMPANY": "SAP AG"
  "PROFILES": [
      "BAPIPROF": "T_ALM_CONF",
      "BAPIPTEXT": "Profile for the Role SAP_ALM_ADMINISTRATOR",
      "BAPITYPE": "G",
      "BAPIAKTPS": "A"
    }
  ],
  "ACTIVITYGROUPS": [
      "AGR NAME": "SAP_ALM_ADMINISTRATOR",
      "FROM_DAT": "2016-04-20",
      "TO DAT": "9999-12-31",
      "AGR TEXT": "Alert Management Administrator"
    },
      "AGR_NAME": "SAP_AUDITOR_SA_CCM_USR",
```

```
"FROM_DAT": "2016-05-01",
    "TO_DAT": "2017-04-30",
    "AGR_TEXT": "AIS - System Audit - Users and Authorizations"
    }
],
    "__NAME__": "SCARTER"
}
```

When a role is granted, the corresponding profiles are attached to the user account automatically.

## 7.4.3.7.2. Updating a User's Roles

To update a user's roles, send a PUT request to the user's ID, specifying the new roles as an array of values of the ACTIVITYGROUPS attribute. The values provided in the PUT request will replace the current ACTIVITYGROUPS.

The following example removes the SAP\_AUDITOR\_SA\_CCM\_USR role and changes the temporal constraints on the SAP\_ALM\_ADMINISTRATOR role for SCARTER's account:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --header "Content-Type: application/json" \
 --header "If-Match: *" \
 --request PUT \
 --data '{
  "ACTIVITYGROUPS": [
      "AGR_NAME": "SAP_ALM_ADMINISTRATOR",
      "FROM_DAT": "2015-06-02",
      "TO_DAT": "2016-06-02"
 ]
 "http://localhost:8080/openidm/system/mysap/user/SCARTER"
  " id": "SCARTER",
  "COMPANY": {
    "COMPANY": "SAP AG"
  "PROFILES": [
      "BAPIPROF": "T_ALM_CONF",
      "BAPIPTEXT": "Profile for the Role SAP_ALM_ADMINISTRATOR",
      "BAPITYPE": "G",
      "BAPIAKTPS": "A"
   }
 ],
  "ACTIVITYGROUPS": [
      "AGR NAME": "SAP ALM ADMINISTRATOR",
      "FROM_DAT": "2015-06-02",
      "TO DAT": "2016-06-02",
      "AGR TEXT": "Alert Management Administrator"
```

```
],
"__NAME__": "SCARTER"
}
```

## 7.4.3.7.3. Removing All Roles From a User Account

To remove all roles from a user's account, update the value of the ACTIVITYGROUPS attribute with an empty array. The following example removes all roles from SCARTER's account:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --header "Content-Type: application/json" \
 --header "If-Match: *" \
 --request PUT \
 --data '{
   "ACTIVITYGROUPS": []
 "http://localhost:8080/openidm/system/mysap/user/SCARTER"
  " id": "SCARTER",
  "COMPANY": {
    "COMPANY": "SAP AG"
  "LASTMODIFIED": {
    "MODDATE": "2016-04-21",
    "MODTIME": "04:27:00"
    NAME ": "SCARTER"
```

The output shows no ACTIVITYGROUPS attribute, as this attribute is now empty.

# 7.5. Configuring the SAP Connector For SNC

The SAP connector supports an SNC (Secure Network Connection) configuration. SNC is a software layer in the SAP System architecture that provides an interface to an external security product.

For a list of the configuration properties specific to SNC, see "SAP Secure Network Connection Configuration Properties".

# 7.6. Implementation Specifics

For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The SAP connector implements the add, remove, and replace operations but the sample scripts provided with the connector implement only the replace operation. If you use these sample scripts, a PATCH request will therefore always replace the entire attribute value with the new value.

## 7.6.1. Setting Productive Passwords on the SAP System

Synchronization of passwords to the SAP system *requires* that you configure SNC and SSO. If you do not configure these two elements correctly, passwords that are updated by IDM are set as *initial* passwords rather than *productive* passwords, and users are forced to change their passwords on login.

1. To configure the SAP connector to use SNC, set the sncMode property to "1".

To configure the connector to use SSO with SNC, set the sncSSO property to "1".

2. The logon session during which a productive password is set must be secured using the authentication method Single Sign-On (SSO) using Secure Network Communications (SNC). IDM must request and receive an SSO logon ticket from the SAP system to allow the BAPI\_USER\_CHANGE process to set a productive password. For more information, see the corresponding SAP Note 1287410 at https://service.sap.com/sap/support/notes/1287410.

To configure the connector to request this logon ticket, set the value of the x509Cert property as follows:

• If you are using an X509 certificate to negotiate with the SAP server, set the x509Cert property to the base 64-encoded certificate.

Note that the certificate must be a valid, CA-signed certificate. You cannot use a self-signed certificate here.

• If you are not using an X509 certificate to negotiate with the SAP server, set the x509Cert property to null.

In this case, the connector will use the user and password specified in the connector configuration to request the SSO logon ticket.

# 7.7. OpenICF Interfaces Implemented by the SAP Connector

The SAP Connector implements the following OpenICF interfaces.

### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

### Delete

Deletes an object, referenced by its uid.

### Resolve Username

Resolves an object by its username and returns the uid of the object.

### Schema

Describes the object types, operations, and options that the connector supports.

## **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

### Search

Searches the target resource for all objects that match the specified object class and filter.

### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

### **Update**

Updates (modifies or replaces) objects on a target resource.

# 7.8. SAP Connector Configuration

The SAP Connector has the following configurable properties.

## 7.8.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
createScriptFileName	String	null		Create
Description is not available				
targetDirectory	File	null		No
Description is not available				
customizerScriptFileName	String	null		No
Description is not available				
warningLevel	int	1		No
Description is not available				
scriptExtensions	String[]	['groovy']		No
Description is not available		·	·	
scriptBaseClass	String	null		No
Description is not available		'	·	
scriptRoots	String[]	null		Yes
Description is not available				
resolveUsernameScriptFileName	String	null		Resolve Username
Description is not available				
tolerance	int	10		No
Description is not available				
updateScriptFileName	String	null		Update
Description is not available				
disabledGlobalASTTransformations	String[]	null		No
Description is not available				
schemaScriptFileName	String	null		Schema
Description is not available				

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
sourceEncoding	String	UTF-8		No
Description is not available				
recompileGroovySource	boolean	false		No
Description is not available				
customSensitiveConfiguration	GuardedString	null	Yes	No
Description is not available				
authenticateScriptFileName	String	null		Authenticate
Description is not available				
scriptOnResourceScriptFileName	String	null		Script On Resource
Description is not available				
minimumRecompilationInterval	int	100		No
Description is not available				
deleteScriptFileName	String	null		Delete
Description is not available				
customConfiguration	String	null		No
Description is not available				
searchScriptFileName	String	null		Get Search
Description is not available				
debug	boolean	false		No
Description is not available				
classpath	String[]	[]		No
Description is not available				
verbose	boolean	false		No
Description is not available				
testScriptFileName	String	null		Test
Description is not available				
syncScriptFileName	String	null		Sync

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
Description is not available				
x509Cert	String	null	Yes	No
Description is not available				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 7.8.2. Basic Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
asHost	String	null		Yes		
The FQDN of your SAP Application Server, for example sap.example.com						
gwHost	String	null		Yes		
SAP gateway host name						
gwServ	String	null		Yes		
SAP gateway service						
user	String	null		Yes		
SAP Logon user						
password	GuardedString	null	Yes	Yes		
SAP Logon password						
client	String	000		Yes		
SAP client						
systemNumber	String	00		Yes		
SAP system number						
language	String	EN		Yes		
SAP Logon language		'				
destination	String	OPENIDM		Yes		
SAP JCo destination name						
directConnection	boolean	true		Yes		
If true, direct connection to a SAP instances through an SA		n server or SAP	router. If false connec	ction to a group of		
sapRouter	String	null		Yes		

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
SAP router string to use for a system protected by a firewall. (/H/host[/S/port])						

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 7.8.3. SAP Jco Logs Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
trace	String	Θ		No
Enable/disable RFC trace (0 or 1)				
cpicTrace	String	0		No
Enable/disable CPIC trace [03]				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 7.8.4. Advanced Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
msHost	String	null		No		
Specifies the host that the message server is running on						
group	String	null		No		
Specifies the group name of the application servers, used when you log in to a logon group that uses load balancing						
msServ	String	null		No		
Name of the service where the message server can be reached						
r3Name	String	null		No		
Specifies the name of the SAP system, used when you log in to a logon group that uses load balancing						

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 7.8.5. SAP Secure Network Connection Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
sncMode	String	Θ		Yes	
Flag used to activate SNC. Possible values are 0 (OFF) and 1 (ON).					

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
sncQoP	String	3		No		
Specifies the security level to use for the connection. Possible values are 1 - Authentication only, 2 - Integrity protection, 3 - Privacy protection, 8 - Use the value from snc/data_protection/use on the application server, 9 - Use the value from snc/data_protection/max on the application server						
sncLibrary	String	null		No		
Specifies the path to the external like system-defined library as defined in			onnection service. T	The default is the		
sncPartnerName	String	null		No		
Specifies the AS ABAP SNC name, for application server SNC name in the	• • •		<b>0</b> ·	n find the		
sncMyName	String	null		No		
Specifies the connector SNC name, for example, "p:CN=OpenIDM, O=MyCompany, C=US". This parameter is optional, but you should set it to make sure that the correct SNC name is used for the connection.						
sncSS0	String	0		No		
Specifies whether the connection shand 1 (ON).	ould be configured	for single sign-on	(SSO). Possible valu	ies are 0 (OFF)		

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

## 7.8.6. JCo Connection Pool Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
poolCapacity	String	1		No	
Maximum number of idle connection	ns kept open by the	destination. $0 = nc$	o connection poolin	g. Default is 1.	
expirationTime	String	60000		No	
Time in ms after that a free connect	ion can be closed. D	efault is one minu	te.		
maxGetTime	String	30000		No	
Maximum time in ms to wait for a cothe pool. Default is 30 seconds.	onnection, if the ma	ximum allowed nu	mber of connection	s is allocated by	
peakLimit	String	0		No	
Maximum number of active connections that can be created for a destination simultaneously. The default is 0 (unlimited).					
expirationPeriod	String	60000		No	
Period in ms after that the destination	on checks the releas	sed connections for	r expiration. Defaul	t is one minute	

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
----------	------	---------	------------------------	-----------------------

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

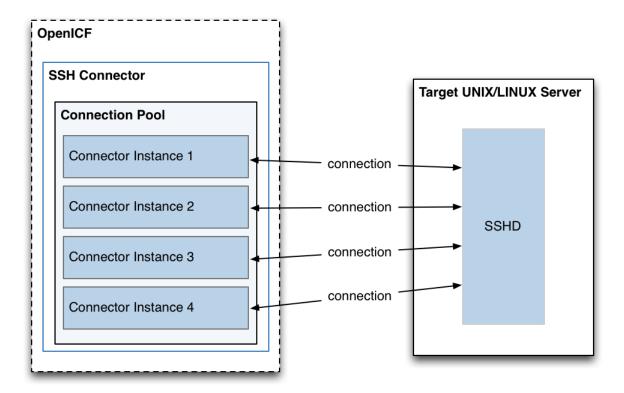

# Chapter 8 SSH Connector

The SSH connector is an implementation of the Scripted Groovy Connector Toolkit, and is based on Java Secure Channel (JSch) and the Java implementation of the Expect library (Expect4j). This connector enables you to interact with any SSH server, using Groovy scripts for the OpenICF operations.

The SSH connector is a *poolable connector*. This means that each connector instance is placed into a connection pool every time an action is completed. Subsequent actions can re-use connector instances from the connector pool. When a new connector instance is created, a new SSH client connection is created against the target SSH server. This SSH connection remains open as long as the connector instance is in the connection pool. Note that when a new action is performed, it finds the SSH connection in the exact state that it was left by the previous action.

The following image shows the relationship between SSH connector instances and SSH connections to the target server:

# 8.1. Configuring Authentication to the SSH Server

The SSH connector authenticates to the SSH server using either a login/password or a public/private key. The authentication method is specified in the authenticationType property in the connector configuration file (conf/provisioner.openicf-ssh.json).

## Authenticating with a login and password

To authenticate with a login and password, set the authenticationType to PASSWORD in the connector configuration file, and set a user and password. For example:

```
"configurationProperties" : {
    ...
    "authenticationType" : "PASSWORD",
    "user" : "<USERNAME>",
    "password" : "<PASSWORD>",
    ...
```

The password is encrypted when IDM loads the provisioner file.

### Authenticating with a passphrase and private key

To authenticate with a secure certificate, generate a pair of public/private keys. Install the public key on the server side and the private key on the IDM host (where the connector is located). Set the authenticationType to PUBKEY in the connector configuration file and set the user, password, passphrase and privateKey properties. For example:

```
"configurationProperties" : {
    "authenticationType" : "PUBKEY",
    "user" : "<USERNAME>",
    "password" : "<PASSWORD>",
    "passphrase" : "secret",
    "privateKey" : ["----BEGIN DSA PRIVATE KEY----"
              "MIIBugIBAAKBgQDcB0ztVMCFptpJhqlLNZSdN/5cDL3S7a0Vy52Ae7vwwCqQPCQr",
              "6NyUk+wtkDr07NlYd3sg7a9hbsEnlYChsuX+/WUIvb0KdMfeqcQ+jKK26YdkTCGj"
              "g86dBj9JYhobSHDoQ9ov31pYN/cfW5BAZwkm9TdpEjHPvMIa0xx7GPGKWwIVALbD"
              "CEuflyJk9UB7v0dmJS7bKkbxAoGARcbAuDP4rB6MsgAAkVwf+1sHXEiGPShYWrVV"
              "qBgCZ/S45ELqUuiaN/1N/nip/Cc/OSBPKqwl7o50CUg9GH9kTAjmXiwmbkwvtUv+"
              "Xjn5vCHS0w18yc3rGwyr2wj+D9KtDLFJ8+T5HmsbPoDQ3mIZ9xPmRQuRFfVMd9wr"
              "DYORs7cCgYAxjGjWDSKThowsvOUCiEOySz6tWggHH3LTrS4Mfh2tOtnbUfrXq2cw"
              "3CN+T6brgnpYbyX5XI17p859C+cw90MD8N6vvBxaN8QMDRFk+hHNUeSy8gXeem9x"
              "OOvdIxCgKvA4dh5nSVb5VGKENEGNEHRlYxEPzbqlPa/C/ZvzIvdKXQIUQMoidPFC",
              "n9z+mE2dAADnPf2m9vk="
              "----END DSA PRIVATE KEY----"
             ],
```

The default value for the passphrase property is null. If you do not set a passphrase for the private key, the passphrase value must be equal to an empty string.

You *must* set a value for the password property, because the connector uses sudo to perform actions on the SSH server.

The private key (PEM certificate) must be defined as a ISON String array.

The values of the passphrase, password and privateKey are encrypted when IDM loads the provisioner file.

# 8.2. Configuring the SSH Connector

IDM provides a sample connector configuration (provisioner.openicf-ssh.json) in the /path/to/openidm/samples/ssh/conf/ directory. You can copy the sample connector configuration to your project's conf/directory, and adjust it to match your Kerberos environment.

Set the authentication properties, as described in "Configuring Authentication to the SSH Server". In addition, set at least the following properties:

### host

Specify the hostname or IP address of the SSH server.

#### port

Set the port on which the SSH server listens.

Default: 22

#### user

The username of the account that connects to the SSH server.

This account must be able to ssh into the server, with the password provided in the next parameter.

### password

The password of the account that is used to connect to the SSH server.

### prompt

A string representing the remote SSH session prompt. This must be the exact prompt string, in the format username@target:, for example admin@myserver:\* . Include any trailing spaces.

The following list describes the configuration properties of the SSH connector shown in the sample connector configuration file. You can generally use the defaults provided in the sample connector configuration file, in most cases. For a complete list of all the configuration properties of the SSH connector, see "Configuration Properties".

#### sudoCommand

A string that shows the full path to the **sudo** command, for example /usr/bin/sudo.

### echoOff

If set to true (the default), the input command echo is disabled. If set to false, every character that is sent to the server is sent back to the client in the expect() call.

### terminalType

Sets the terminal type to use for the session. The list of supported types is determined by your Linux/UNIX system. For more information, see the terminfo manual page (\$ man terminfo).

Default: vt102

### setLocale

If set to true, indicates that the default environment locale should be changed to the value of the locale property.

Default: false

### locale

Sets the locale for the LC\_ALL, LANG and LANGUAGE environment variables, if setLocale is set to true.

Default: en US.utf8

### connectionTimeout

Specifies the connection timeout to the remote server, in milliseconds.

Default: 5000

### expectTimeout

Specifies the timeout used by the expect() calls in scripts, in milliseconds.

Default: 5000

### authenticationType

Sets the authentication type, either PASSWORD or PUBKEY. For more information, see "Configuring Authentication to the SSH Server".

Default: PASSWORD

### throwOperationTimeoutException

If true, the connector throws an exception when the expectTimeout is reached for an operation. Otherwise, the operation fails silently.

Default: true

### scriptRoots

The path to the Groovy scripts that will perform the OpenICF operations, relative to your IDM installation directory. The sample connector configuration expects the scripts in project-dir/tools, so this parameter is set to &{launcher.project.location}/tools in the sample configuration.

### classpath

The directory in which the compiler should look for compiled classes. The default classpath, if not is specified, is install-dir/lib.

### reloadScriptOnExecution

By default, scripts are loaded and compiled when a connector instance is created and initialized. Setting <code>reloadScriptOnExecution</code> to true makes the connector load and compile the script every time it is called. Do not set this property to <code>true</code> in a production environment, because it will have a significant impact on performance.

Default: false

### \*ScriptFileName

The name of the Groovy script that is used for each OpenICF operation.

# 8.3. OpenICF Interfaces Implemented by the SSH Connector

The SSH Connector implements the following OpenICF interfaces.

### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

### Create

Creates an object and its uid.

### Delete

Deletes an object, referenced by its uid.

### Resolve Username

Resolves an object by its username and returns the uid of the object.

### Schema

Describes the object types, operations, and options that the connector supports.

## **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

### Search

Searches the target resource for all objects that match the specified object class and filter.

### Sync

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a

physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

## **Update**

Updates (modifies or replaces) objects on a target resource.

# 8.4. SSH Connector Configuration

The SSH Connector has the following configurable properties.

## 8.4.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
customSensitiveConfiguration	GuardedString	null	Yes	No

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

## Chapter 9

# Google Apps Connector

IDM bundles a Google Apps connector, along with a sample connector configuration. The Google Apps connector enables you to interact with Google's web applications.

The Google Apps connector is subject to the API Limits and Quotas that are imposed by Google. The connector also adheres to the implementation guidelines set out by Google for implementing exponential backoff.

# 9.1. Configuring the Google Apps Connector

The Google Apps connector uses OAuth2 to authorize the connection to the Google service. To use this authorization mechanism, you must supply a clientId and clientSecret in order to obtain an access token from Google. You can obtain the clientId and clientKey from the Google Developers Console after you have configured your Web Application.

A sample Google Apps connector configuration file is provided in samples/example-configurations/
provisioners/provisioner.openicf-google.json

The following is an excerpt of the provisioner configuration file. This example shows an excerpt of the provisioner configuration. The default location of the connector .jar is openidm/connectors. Therefore the value of the connectorHostRef property must be "#LOCAL":

```
"connectorHostRef": "#LOCAL",
  "connectorName": "org.forgerock.openicf.connectors.googleapps.GoogleAppsConnector",
  "bundleName": "org.forgerock.openicf.connectors.googleapps-connector",
  "bundleVersion": "[1.4.0.0,2.0.0.0)"
},
```

The following excerpt shows the required configuration properties:

```
"configurationProperties": {
    "domain": "",
    "clientId": "",
    "clientSecret": null,
    "refreshToken": null
},
```

These configuration properties are fairly straightforward:

### domain

Set to the domain name for OAuth 2-based authorization.

### clientId

A client identifier, as issued by the OAuth 2 authorization server. For more information, see the following section of RFC 6749: *Client Identifier*.

### clientSecret

Sometimes also known as the client password. OAuth 2 authorization servers can support the use of clientId and clientSecret credentials, as noted in the following section of RFC 6749: Client Password.

### refreshToken

A client can use an OAuth 2 refresh token to continue accessing resources. For more information, see the following section of RFC 6749: *Refresh Tokens*.

For a sample Google Apps configuration that includes OAuth 2-based entries for configurationProperties, see "Synchronizing Accounts With the Google Apps Connector" in the Samples Guide.

# 9.2. OpenICF Interfaces Implemented by the GoogleApps Connector

The GoogleApps Connector implements the following OpenICF interfaces.

### Create

Creates an object and its uid.

### Delete

Deletes an object, referenced by its uid.

### **Schema**

Describes the object types, operations, and options that the connector supports.

### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.

• The script has access to any script-arguments passed in by the application.

### Search

Searches the target resource for all objects that match the specified object class and filter.

### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

## **Update**

Updates (modifies or replaces) objects on a target resource.

# 9.3. GoogleApps Connector Configuration

The GoogleApps Connector has the following configurable properties.

## 9.3.1. Basic Configuration Properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
domain	String	null		Yes
Internet domain name. See https://s	upport.google.com/	a/answer/177483?	hl=en	,
clientId	String	null		Yes
Client identifier issued to the client	during the registrat	tion process.		
clientSecret	GuardedString	null	Yes	Yes
Client secret issued to the client dur	ring the registration	process.		
refreshToken	GuardedString	null	Yes	Yes
The refresh token allows you to get expire, they can only be revoked by				n tokens never

a Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# 9.4. Supported Resource Types

The Google Apps connector uses the Google Enterprise License Manager and Directory APIs to perform CRUD operations against resources within a Google Apps domain.

The following table lists the resource types that are supported by the Google Apps connector:

## Supported Resource Types With the Google Apps Connector

<b>OpenICF Native Type</b>	Google Resource Type	Naming Attribute
_ACCOUNT_	user	primaryEmail
GROUP	group	email
Member	member	{groupKey}/email
OrgUnit	orgUnit	{parentOrgUnitPath}/_NAME_
LicenseAssignment	licenseAssignment	{productId}/sku/{skuId}/user/ {primaryEmail}

## 9.5. Functional Limitations

The Google Apps connector is subject to the following functional limitations:

- The connector does not implement the OpenICF Sync operation so you cannot use the connector for liveSync of supported Google Apps resources to IDM managed objects.
- The connector does not implement the Authenticate operation so you cannot use the connector to perform pass-through authentication between IDM and a Google Apps domain. You can also not use this connector to perform password Change operations (as opposed to password Reset) because the connector cannot authenticate on behalf of the end-user.
- Support for Filters when performing Search operations is limited to those attributes described in "Supported Search Filters".
- Google Apps creates a new User Alias each time the primaryEmail address associated with the User
  object is modified. You cannot delete User Aliases with the Google Apps connector so you must
  manage Aliases directly from within the Google Apps console.
- The Google Apps connector does not support custom schemas. The connector is therefore not able to read or update attributes associated with custom schemas in your Google Apps domain.
- For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The Google Apps connector does not implement the add or remove operations, so a PATCH request always replaces the entire attribute value with the new value.

# 9.6. Supported Search Filters

The Google Apps connector supports filtered searches against Google Apps resources. However, limitations imposed by the APIs provided by the Google Apps Admin SDK prevent filtering of resource types based on arbitrary attributes and values.

The following filter operators and attributes are supported for Search operations with the Google Apps connector:

## Supported Operators and Filter Attributes With Google Apps Searches

Object Type	Operators	Attributes
_ACCOUNT_	And, Contains, StartsWith, Equals	primaryEmail
_GROUP_	Contains, Equals	email
Member	Equals	{groupKey}/email
OrgUnit	StartsWith	{parentOrgUnitPath}/_NAME_
LicenseAssignment	Equals	{productId}/sku/{skuId}/user/ {primaryEmail}

# Chapter 10 Kerberos Connector

The Kerberos connector is an implementation of the SSH connector, and is based on Java Secure Channel (JSch) and the Java implementation of the Expect library (Expect4j). The connector depends on the following files, provided with IDM:

- /path/to/openidm/lib/ssh-connector-1.4.2.0.jar
- /path/to/openidm/lib/expect4j-<version>.jar
- /path/to/openidm/lib/jsch-<version>.jar

The Kerberos connector enables you to manage Kerberos user principals from IDM. The connector is provided in <code>/path/to/openidm/connectors/kerberos-connector-1.4.3.0.jar</code> and bundles a number of Groovy scripts to interact with a Kerberos admin server. Users of the Kerberos connector are not expected to edit the bundled Groovy scripts. The bundled scripts use the <code>kadmin</code> utility to communicate with the Kerberos server.

The Kerberos connector enables you to perform the following operations on Kerberos user principals.

- List the existing principals
- · Display the details of a principal
- Add a user principal
- Change the password of a user principal and unlock the principal
- Delete a user principal

## 10.1. Kerberos Connector Schema

The Kerberos connector can only be used to manage the Kerberos principal object type (which maps to the OpenICF ACCOUNT object). The following attributes are supported in the schema:

- principal (maps to \_\_NAME\_\_ and \_\_UID\_\_)
- PASSWORD updatable, required when an object is created
- \_LOCK\_OUT\_\_ updatable only; unlock an account by setting this attribute to false
- policy the password policy used by the principal

- expirationDate the date that the user principal expires
- passwordExpiration the date that the password expires
- maximumTicketLife the maximum ticket life for the principal. At the end of the ticket lifetime, the ticket can no longer be used. However, if the renewable lifetime (maximumRenewableLife) is longer than the ticket lifetime, the ticket holder can present the ticket to the KDC and request a new ticket.
- maximumRenewableLife the period during which the ticket can be renewed. A renewed ticket usually has a new ticket lifetime, dating from the time that it was renewed, that is constrained by the renewable ticket lifetime.

In addition, the following read-only attributes are supported:

- lastPasswordChange
- lastModified
- lastSuccessfulAuthentication
- lastFailedAuthentication
- failedPasswordAttempts

# 10.2. Configuring the Kerberos Connector

A sample connector configuration (provisioner.openicf-kerberos.json) is provided in the /path/to/openidm/samples/sync-with-kerberos/conf/ directory. You can copy the sample connector configuration to your project's conf/ directory, and adjust it to match your Kerberos environment.

Set the authentication properties, as described in "Configuring Authentication to the SSH Server". In addition, set at least the following properties:

## customConfiguration

Specify the details of the user principal and the default realm here. The sample provisioner file has the following custom configuration:

```
"customConfiguration" : "kadmin{
  cmd = '/usr/sbin/kadmin.local';
  user = '<KADMIN USERNAME>';
  default_realm = '<REALM, e.g. EXAMPLE.COM>'
}",
```

A complete custom configuration will look something like this:

```
"customConfiguration" : "kadmin {
    cmd = '/usr/sbin/kadmin.local';
    user = 'openidm/admin';
    default_realm = 'EXAMPLE.COM' }",
```

### **customSensitiveConfiguration**

Set the password for the user principal here. The sample provisioner has the following configuration:

```
"customSensitiveConfiguration" : "kadmin { password = '<KADMIN PASSWORD>'}",
```

Change this to reflect your user principal password, for example:

```
"customSensitiveConfiguration" : "kadmin { password = 'Passw0rd'}"
```

The following section describes the configuration parameters in the sample Kerberos connector configuration. For a complete list of the configuration properties for the Kerberos connector, see "Configuration Properties":

### host

The host name or IP address of the SSH server on which the kadmin command is run.

### port

The port number on which the SSH server listens.

Default: 22 (the default SSH port)

#### user

The username of the account that is used to connect to the SSH server.

### Note

This is *not* the same as your Kerberos user principal. This account must be able to **ssh** into the server on which Kerberos is running, with the password provided in the next parameter.

### password

The password of the account that is used to connect to the SSH server.

### prompt

A string representing the remote SSH session prompt. This must be the exact prompt string, in the format username@target:, for example root@localhost:~\$.

If the prompt includes a trailing space, you must include the space in the value of this property.

Consider customizing your Linux prompt with the PS1 and PS2 variables, to set a *safe* prompt. For information about customizing promtps, see this article.

### sudoCommand

A string that shows the full path to the **sudo** command, for example /usr/bin/sudo.

### echoOff

If set to true (the default), the input command echo is disabled. If set to false, every character that is sent to the server is sent back to the client in the expect() call.

### terminalType

Sets the terminal type to use for the session. The list of supported types is determined by your Linux/UNIX system. For more information, see the terminfo manual page (\$ man terminfo).

Default: vt102

#### setLocale

If set to true, indicates that the default environment locale should be changed to the value of the locale property.

Default: false

### locale

Sets the locale for LC\_ALL, LANG and LANGUAGE environment variables, if setLocale is set to true.

Default: en\_US.utf8

### connectionTimeout

Specifies the connection timeout to the remote server, in milliseconds.

Default: 5000

### expectTimeout

Specifies the timeout used by the expect() calls in scripts, in milliseconds.

Default: 5000

### authenticationType

Sets the authentication type, either PASSWORD or PUBKEY. For more information, see "Configuring Authentication to the SSH Server".

Default: PASSWORD

### throwOperationTimeoutException

If true, the connector throws an exception when the timeout is reached for an operation. Otherwise, the operation fails silently.

Default: true

### scriptRoots

The path to the Groovy scripts that will perform the OpenICF operations, relative to your installation directory. For the Kerberos connector, the scripts are bundled up in the connector JAR file, so this path is set to <code>jar:file:connectors/kerberos-connector-1.4.3.0.jar!/script/kerberos/</code> in the sample connector configuration.

### classpath

The directory in which the compiler should look for compiled classes. The default classpath, if not is specified, is install-dir/lib.

### reloadScriptOnExecution

By default, scripts are loaded and compiled when a connector instance is created and initialized. Setting reloadScriptOnExecution to true makes the connector load and compile the script every time it is called. Do not set this property to true in a production environment, because it will have a significant impact on performance.

Default: false

### \*ScriptFileName

The script that is used for each OpenICF operation. Do not change these script names in the bundled Kerberos connector.

# 10.3. OpenICF Interfaces Implemented by the Kerberos Connector

The Kerberos Connector implements the following OpenICF interfaces.

### **Authenticate**

Provides simple authentication with two parameters, presumed to be a user name and password.

### Create

Creates an object and its uid.

### **Delete**

Deletes an object, referenced by its uid.

### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

### Schema

Describes the object types, operations, and options that the connector supports.

## **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

### Search

Searches the target resource for all objects that match the specified object class and filter.

## Sync

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

## **Update**

Updates (modifies or replaces) objects on a target resource.

## 10.4. Kerberos Connector Configuration

The Kerberos Connector has the following configurable properties.

# 10.4.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
customSensitiveConfiguration	GuardedString	null	Yes	No

Description is not available				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# Chapter 11 Salesforce Connector

IDM provides a Salesforce connector, along with a sample connector configuration. The Salesforce connector enables provisioning, reconciliation, and synchronization between Salesforce and the IDM repository.

The Salesforce Connector is not an OpenICF connector, but a separate IDM module, based on the ForgeRock Common Resource API.

To use this connector, you need a Salesforce account, and a Connected App that has OAuth enabled, which will allow you to retrieve the required consumer key and consumer secret.

For additional instructions, and a sample Salesforce configuration, see "Synchronizing Users Between Salesforce and IDM" in the Samples Guide.

# Chapter 12 Marketo Connector

The Marketo connector enables synchronization between IDM managed users and a Marketo Lead Database.

This connector forms part of ForgeRock's support for customer data management (CDM). You can synchronize any managed user to Marketo - those who have been added directly to the IDM repository, and those who have registered themselves through one of the Social Identity Providers described in "Configuring Social Identity Providers" in the Integrator's Guide.

The Marketo connector is an implementation of the Scripted Groovy Connector Toolkit, and enables you to interact with leads in a Marketo database, using Groovy scripts for the OpenICF operations.

To use the Marketo connector, you need a Marketo account, a client ID, client secret, and the REST API URL for your IDM service, and a custom list created in your Marketo Leads database. For information on obtaining these details from Marketo, see the Marketo documentation.

A sample connector configuration file is available, at /path/to/openidm/samples/example-configurations/provisioner.openicf-marketo.json. To test the Marketo connector, copy that file to your project's conf/ directory, and edit at least the configurationProperties to provide the REST API URL, client ID and client secret. To locate the REST API endpoint URL, select Admin > Web Services in Marketo, scroll down to REST API, and find the endpoint. Use that REST endpoint as the value of the instance property in your connector configuration. Remove the protocol and /rest from the URL. For example, if the endpoint is https://l40-0CV-xxx.mktorest.com/rest, the value of the instance property must be 140-0CV-xxx.mktorest.com.

Set the enabled property in the connector configuration to true. IDM encrypts the client secret on startup. Optionally, you can specify the listName to which leads should be added when they are synchronized from IDM. The following excerpt of a sample connector configuration file shows the properties that you must set:

```
"name" : "marketo",
  "displayName" : "MarketoConnector",
  "description" : "Connector used to sync users to Marketo leads",
  "version" : "1.4.3.0",
  "author" : "ForgeRock",
  "enabled" : true,
  ...
  "configurationProperties" : {
      "instance" : "140-OCV-xxx.mktorest.com",
      "clientId" : "1b5fxxxxxxxxxxxxxxxxxxxxxxxx6a2c",
      "clientSecret" : "19jf910703j19012790j0123i-d1",
      "leadFields" : null,
      "partitionName" : null,
      "listName" : "DecemberPromotion",
      ...
```

You can also configure the Marketo connector through the Admin UI. Select Configure > Connectors, click New Connector, and complete at least the required configuration properties, described in "Marketo Connector Configuration".

When your connector is configured correctly, you can test its status by running the following command:

```
$ curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request POST \
 "http://localhost:8080/openidm/system? action=test"
[
  {
    "name": "marketo",
    "enabled": true,
    "config": "config/provisioner.openicf/marketo",
    "objectTypes": [
      "__ALL__",
"account"
    "connectorRef": {
      "bundleName": "org.forgerock.openicf.connectors.marketo-connector",
      "connectorName": "org.forgerock.openicf.connectors.marketo.MarketoConnector",
      "bundleVersion": "1.4.3.0"
    "displayName": "Marketo Connector",
    "ok": true
 }
]
```

A status of "ok": true indicates that the connector can reach your Marketo database.

For additional instructions on how to set up reconciliation from IDM to Marketo, see "Setting Up Users for Marketo Lead Generation" in the *Integrator's Guide*.

### 12.1. Implementation Specifics

For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The Marketo connector does not implement the add or remove operations, so a PATCH request always replaces the entire attribute value with the new value.

## 12.2. OpenICF Interfaces Implemented by the Marketo Connector

The Marketo Connector implements the following OpenICF interfaces.

#### Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

### **Script on Resource**

Runs a script on the target resource that is managed by this connector.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Sync**

Polls the target resource for synchronization events, that is, native changes to objects on the target resource.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

### **Update**

Updates (modifies or replaces) objects on a target resource.

### 12.3. Marketo Connector Configuration

The Marketo Connector has the following configurable properties.

### 12.3.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
customSensitiveConfiguration	GuardedString	null	Yes	No	
Custom Sensitive Configuration script for Groovy ConfigSlurper					
customConfiguration	String	null		No	
Custom Configuration script for Gro	ovy ConfigSlurper	,			
tokenExpiration	Long	null		No	
Description is not available					
accessToken	String	null		No	
Description is not available					

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>			
instance	String	null		Yes			
The Marketo-assigned FQDN for you	The Marketo-assigned FQDN for your instance						
clientId	String	null		Yes			
Your OAuth2 client ID							
clientSecret	GuardedString	null	Yes	Yes			
Your OAuth2 client secret							
leadFields	String	null		No			
Comma-delimited list of lead fields t	o fetch; Leave empt	ty for default set					
partitionName	String	null		No			
Name of the partition in which to create and update leads; May be left empty							
listName	String	null		Yes			
Name of the Marketo static list the o	connector will use to	o manage leads					

a Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

### 12.3.2. Operation Script Files Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>		
createScriptFileName	String	CreateMarketo .groovy		Create		
The name of the file used to perform the CREATE operation.						
customizerScriptFileName	String	null		No		
The script used to customize some f	unction of the conn	ector. Read the do	cumentation for mo	re details.		
authenticateScriptFileName	String	null		Authenticate		
The name of the file used to perform	the AUTHENTICA	TE operation.				
scriptOnResourceScriptFileName	String	null		Script On Resource		
The name of the file used to perform the RUNSCRIPTONRESOURCE operation.						
deleteScriptFileName	String	DeleteMarketo .groovy		Delete		
The name of the file used to perform the DELETE operation.						

 $<sup>^{\</sup>mathrm{b}}$  A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
resolveUsernameScriptFileName	String	null		Resolve Username
The name of the file used to perform	the RESOLVE_US	ERNAME operation	n.	
searchScriptFileName	String	SearchMarketo .groovy		Get Search
The name of the file used to perform	the SEARCH opera	ation.		
updateScriptFileName	String	UpdateMarketo .groovy		Update
The name of the file used to perform	the UPDATE opera	ation.		
schemaScriptFileName	String	SchemaMarketo .groovy		Schema
The name of the file used to perform	the SCHEMA oper	ation.		
testScriptFileName	String	TestMarketo .groovy		Test
The name of the file used to perform the TEST operation.				
syncScriptFileName	String	null		Sync
The name of the file used to perform	the SYNC operation	n.		

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

### 12.3.3. Groovy Engine configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
targetDirectory	File	null		No	
Directory into which to write classes.					
warningLevel	int	1		No	
Warning Level of the compiler					
scriptExtensions	String[]	['groovy']		No	
Description is not available					
minimumRecompilationInterval	int	100		No	
Sets the minimum of time after a script can be recompiled.					
scriptBaseClass	String	null		No	
Base class name for scripts (must	derive from Script)				

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
scriptRoots	String[]	null		Yes
The root folder to load the scripts fr	rom. If the value is r	null or empty the c	asspath value is us	ed.
tolerance	int	10		No
The error tolerance, which is the nu compilation is aborted.	imber of non-fatal e	rrors (per unit) tha	t should be tolerate	ed before
debug	boolean	false		No
If true, debugging code should be a	ctivated			
classpath	String[]	[]		No
Classpath for use during compilatio	n.			
disabledGlobalASTTransformations	String[]	null		No
Sets a list of global AST transforma org.codehaus.groovy.transform.AST				in META-INF/
verbose	boolean	false		No
If true, the compiler should produce	e action information			,
sourceEncoding	String	UTF-8		No
Encoding for source files				
recompileGroovySource	boolean	false		No
If set to true recompilation is enable	ed			

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM. <sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

# Chapter 13 Active Directory Connector

The Active Directory connector is a legacy connector, written in C# for the .NET platform. OpenICF connects to Active Directory over ADSI, the native connection protocol for Active Directory. The connector therefore requires a .NET connector server that has access to the ADSI .dll files.

#### **Important**

The AD Connector is deprecated and support for its use with IDM will be discontinued in a future release. For simple Active Directory (and Active Directory LDS) deployments, the generic LDAP Connector works better than the Active Directory connector, in most circumstances. Using the generic LDAP connector avoids the need to install a remote connector server in the overall deployment. In addition, the generic LDAP connector has significant performance advantages over the Active Directory connector. For more complex Active Directory deployments, use the PowerShell Connector Toolkit, as described in "PowerShell Connector Toolkit".

### 13.1. Configuring the Active Directory Connector

Before you configure the Active Directory Connector, make sure that the .NET Connector Server is installed, configured and started, and that IDM has been configured to use the Connector Server. For more information, see "Installing and Configuring a .NET Connector Server" in the *Integrator's Guide*.

### Setting Up the Active Directory Connector

- 1. Download the Active Directory (AD) Connector from ForgeRock's BackStage site.
- 2. Extract the contents of the AD Connector zip file into the directory in which you installed the Connector Server (by default c:\Program Files (x86)\Identity Connectors\Connector Server>).

Note that the files, specifically the connector itself (ActiveDirectory.Connector.dll) must be directly under the path\to\Identity Connectors\Connector Server directory, and not in a subdirectory.

#### Note

If the account that is used to install the Active Directory connector is different from the account under which the Connector Server runs, you must give the Connector Server runtime account the rights to access the Active Directory connector log files.

3. A sample Active Directory Connector configuration file is provided in <a href="mailto:openidm/samples/example-configurations/provisioners/provisioner.openicf-ad.json">openidm/samples/example-configurations/provisioners/provisioner.openicf-ad.json</a>. On the IDM host, copy the sample Active Directory connector configuration file to your project's <a href="mailto:conff/directory">conff/directory</a>:

```
$ cd /path/to/openidm
$ cp samples/example-configurations/provisioners/provisioner.openicf-ad.json project-dir/conf/
```

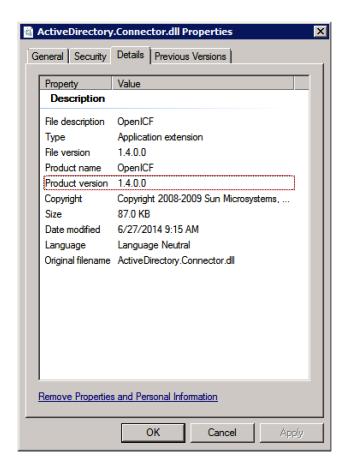

4. Edit the Active Directory connector configuration to match your Active Directory deployment.

Specifically, check and edit the configurationProperties that define the connection details to the Active Directory server.

Also, check that the bundleVersion of the connector matches the version of the ActiveDirectory.Connector.dll in the Connector Server directory. The bundle version can be a range that includes the version of the connector bundle. To check the .dll version:

- Right click on the ActiveDirectory.Connector.dll file and select Properties.
- Select the Details tab and note the Product Version.

The following configuration extract shows sample values for the connectorRef and configurationProperties:

```
"connectorRef" :
  {
      "connectorHostRef" : "dotnet",
      "connectorName" : "Org.IdentityConnectors.ActiveDirectory.ActiveDirectoryConnector",
      "bundleName" : "ActiveDirectory.Connector",
      "bundleVersion" : "[1.4.0.0,1.5.0.0)"
  },
"configurationProperties":
      "DirectoryAdminName" : "EXAMPLE\\Administrator",
      "DirectoryAdminPassword" : "Passw0rd",
      "ObjectClass" : "User",
"Container" : "dc=example,dc=com",
      "CreateHomeDirectory" : true,
      "LDAPHostName" : "192.0.2.0",
      "SearchChildDomains" : false,
      "DomainName" : "example".
      "SyncGlobalCatalogServer" : null,
      "SvncDomainController" : null.
      "SearchContext" : ""
  },
```

The main configurable properties are as follows:

#### connectorHostRef

Must point to an existing connector info provider configuration in <a href="mailto:project-dir/conf/">project-dir/conf/</a> provisioner.openicf.connectorinfoprovider.json. The connectorHostRef property is required because the Active Directory connector must be installed on a .NET connector server, which is always remote, relative to IDM.

#### DirectoryAdminName and DirectoryAdminPassword

Specify the credentials of an administrator account in Active Directory, that the connector will use to bind to the server.

The DirectoryAdminName can be specified as a bind DN, or in the format DomainName\\samaccountname.

#### **SearchChildDomains**

Specifies if a Global Catalog (GC) should be used. This parameter is used in search and query operations. A Global Catalog is a read-only, partial copy of the entire forest, and is never used for create, update or delete operations.

Boolean, false by default.

#### **LDAPHostName**

Specifies a particular Domain Controller (DC) or Global Catalog (GC), using its hostname. This parameter is used for query, create, update, and delete operations.

If SearchChildDomains is set to true, this specific GC will be used for search and query operations. If the LDAPHostName is null (as it is by default), the connector will allow the ADSI libraries to pick up a valid DC or GC each time it needs to perform a query, create, update, or delete operation.

#### SyncGlobalCatalogServer

Specifies a Global Catalog server name for sync operations. This property is used in combination with the SearchChildDomains property.

If a value for <code>SyncGlobalCatalogServer</code> is set (that is, the value is not <code>null</code>) and <code>SearchChildDomains</code> is set to <code>true</code>, this GC server is used for sync operations. If no value for <code>SyncGlobalCatalogServer</code> is set and <code>SearchChildDomains</code> is set to <code>true</code>, the connector allows the ADSI libraries to pick up a valid GC.

#### **SyncDomainController**

Specifies a particular DC server for sync operations. If no DC is specified, the connector picks up the first available DC and retains this DC in future sync operations.

The updated configuration is applied immediately.

5. Check that the connector has been configured correctly by running the following command:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request POST \
"http://localhost:8080/openidm/system?_action=test"
```

The command must return "ok": true for the Active Directory connector.

6. The connector is now configured. To verify the configuration, perform a RESTful GET request on the remote system URL, for example:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
--request GET \
"http://localhost:8080/openidm/system/ActiveDirectory/account?_queryId=query-all-ids"
```

This request should return the user accounts in the Active Directory server.

7. (Optional) To configure reconciliation or liveSync between IDM and Active Directory, create a synchronization configuration file (sync.json) in your project's conf/ directory.

The synchronization configuration file defines the attribute mappings and policies that are used during reconciliation.

The following is a simple example of a sync. json file for Active Directory:

```
"mappings" : [
             "name" : "systemADAccounts_managedUser",
             "source" : "system/ActiveDirectory/account",
             "target" : "managed/user",
             "properties" : [
                 { "source" : "cn", "target" : "displayName" },
                   "source" : "description", "target" : "description" },
"source" : "givenName", "target" : "givenName" },
                 { "source" : "sn", "target" : "familyName" },
                 { "source" : "sAMAccountName", "target" : "userName" }
             "policies" : [
                 { "situation" : "CONFIRMED", "action" : "UPDATE" },
                  "situation" : "FOUND", "action" : "UPDATE" },
"situation" : "ABSENT", "action" : "CREATE" },
                 { "situation" : "AMBIGUOUS", "action" : "EXCEPTION" },
                  "situation" : "MISSING", "action" : "UNLINK" },
                 { "situation" : "SOURCE_MISSING", "action" : "DELETE" },
                 { "situation" : "UNQUALIFIED", "action" : "DELETE" },
                 { "situation" : "UNASSIGNED", "action" : "DELETE" }
             ]
        }
    ]
}
```

8. To test the synchronization, run a reconciliation operation as follows:

```
$ curl \
   --header "X-OpenIDM-Username: openidm-admin" \
   --header "X-OpenIDM-Password: openidm-admin" \
   --request POST \
   "http://localhost:8080/openidm/recon?_action=recon&mapping=systemADAccounts_managedUser"
```

If reconciliation is successful, the command returns a reconciliation run ID, similar to the following:

```
{"_id":"0629d920-e29f-4650-889f-4423632481ad","state":"ACTIVE"}
```

9. Query the internal repository, using either a **curl** command, or the IDM Admin UI, to make sure that the users in your Active Directory server were provisioned into the repository.

## 13.2. Using PowerShell Scripts With the Active Directory Connector

The Active Directory connector supports PowerShell scripting. The following example shows a simple PowerShell script that is referenced in the connector configuration and can be called over the REST interface.

#### Note

External script execution is disabled on system endpoints by default. For testing purposes, you can enable script execution over REST, on system endpoints by adding the **script** action to the system object, in the **access.js** file. For example:

```
$ more /path/to/openidm/script/access.js
...
{
    "pattern" : "system/ActiveDirectory",
    "roles" : "openidm-admin",
    "methods" : "action",
    "actions" : "script"
},
```

Be aware that scripts passed to clients imply a security risk in production environments. If you need to expose a script for direct external invocation, it might be better to write a custom authorization function to constrain the script ID that is permitted. Alternatively, do not expose the script action for external invocation, and instead, expose a custom endpoint that can make only the desired script calls. For more information about using custom endpoints, see "Creating Custom Endpoints to Launch Scripts" in the Integrator's Guide.

The following PowerShell script creates a new MS SQL user with a username that is specified when the script is called. The script sets the user's password to Password and, optionally, gives the user a role. Save this script as project-dir/script/createUser.ps1:

```
if ($loginName -ne $NULL) {
    [System.Reflection.Assembly]::LoadWithPartialName('Microsoft.SqlServer.SMO') | Out-Null
    $sqlSrv = New-Object ('Microsoft.SqlServer.Management.Smo.Server') ('WIN-C2MSQ8G1TCA')

$login = New-Object -TypeName ('Microsoft.SqlServer.Management.Smo.Login') ($sqlSrv, $loginName)
    $login.LoginType = 'SqlLogin'
    $login.PasswordExpirationEnabled = $false
    $login.Create('Passw0rd')
# The next two lines are optional, and to give the new login a server role, optional
    $login.AddToRole('sysadmin')
    $login.Alter()
} else {
    $Error_Message = [string]"Required variables 'loginName' is missing!"
        Write-Error $Error_Message
        throw $Error_Message
}
```

Now edit the Active Directory connector configuration to reference the script. Add the following section to the connector configuration file (project-dir/conf/provisioner.openicf-ad.json):

To call the PowerShell script over the REST interface, use the following request, specifying the userName as input:

```
$ curl \
   --header "X-OpenIDM-Username: openidm-admin" \
   --header "X-OpenIDM-Password: openidm-admin" \
   --request POST \
   "http://localhost:8080/openidm/system/ActiveDirectory/?
   _action=script&scriptId=ConnectorScriptName&scriptExecuteMode=resource&loginName=myUser"
```

## Chapter 14 Office 365 Connector

The Office 365 connector uses the O365 Graph API to manage Azure AD users and groups. This connector uses the OData 3.0 specification and can be used, with minor modifications, to connect to any OData 3 provider. Note that OData 2, 3 and 4 are not interchangeable and this connector can only function against OData 3 providers.

The Office 365 connector is available from ForgeRock's BackStage site. If you want to use this connector in production, contact ForgeRock Support.

This chapter lists the implemented interfaces and configurable properties for the Office 365 connector.

### 14.1. Implementation Specifics

For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The Office 365 connector does not implement the add or remove operations, so a PATCH request always replaces the entire attribute value with the new value.

# 14.2. OpenICF Interfaces Implemented by the O365 Connector

The O365 Connector implements the following OpenICF interfaces.

#### Create

Creates an object and its uid.

### **Delete**

Deletes an object, referenced by its uid.

#### **Resolve Username**

Resolves an object by its username and returns the uid of the object.

#### **Schema**

Describes the object types, operations, and options that the connector supports.

### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### **Test**

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

### 14.3. O365 Connector Configuration

The O365 Connector has the following configurable properties.

### 14.3.1. Office 365 OAuth 2 Configuration Properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
tenant	String	null		Yes	
Name of your Office365 tenant					
clientId	String	null		Yes	

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
This value is provided by Office365				
clientSecret	GuardedString	null	Yes	Yes
This value is provided by Office365				
accessToken	String	null		Yes
This value is provided by Office365				,
tokenExpiration	Long	null		No
This value is provided by Office365				
refreshToken	String	null		Yes
This value is provided by Office365				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

### 14.3.2. Office365 AzureAD Configuration Properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
accountEntitySet	String	User		Yes	
The name AzureAD uses to declare account objects in its data payloads					
accountURIComponent	String	users		Yes	
The name used in a URI path to spec	cify an account targ	et object			
groupEntitySet	String	Group		Yes	
The name AzureAD uses to declare group objects in its data payloads					
groupURIComponent	String	groups		Yes	
The name used in a URI path to specify an account target object					

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

## Chapter 15 SCIM Connector

The SCIM connector is based on the Simple Cloud Identity Management (SCIM) protocol and enables you to manage user and group accounts on any SCIM-compliant resource provider, such as Slack or Facebook. The SCIM connector implements both 1.1 and 2.0 endpoints. The SCIM connector is bundled with IDM in the connectors/ directory.

The SCIM connector uses the Apache HTTP client, which leverages the HTTP client connection pool, not the connector pool.

### Configure the SCIM Connector Using the Filesystem

- 1. Download provisioner.openicf-scim.json to your project's conf/ directory.
- 2. Edit conf/provisioner.openicf-scim.json, as necessary. The following changes are required:
  - "enabled" : true
  - To specify the connection details to the SCIM resource provider, set the configurationProperties.
     The required properties vary, based on the authenticationMethod:

#### **OAUTH**

The minimum required properties are grantType, SCIMEndpoint, tokenEndpoint, clientId, and clientSecret.

#### BASIC

The minimum required properties are user and password.

#### **TOKEN**

The minimum required property is authToken.

Sample Configuration Using OAUTH:

```
"configurationProperties" : {
    "SCIMEndpoint" : "https://example.com/scim",
    "SCIMVersion" : 1,
    "authenticationMethod" : "OAUTH",
    "user" : null,
    "password" : null,
    "tokenEndpoint" : "https://example.com/oauth2/token",
    "clientId" : "Kdvl..............j3fka",
    "clientSecret" : "xxxxxxxxxxxxxxxx,
    "acceptSelfSignedCertificates" : true,
    "disableHostNameVerifier" : true,
    "maximumConnections" : 10,
    "httpProxyHost" : null,
    "httpProxyPort" : null
},
```

#### Note

On startup, IDM encrypts the value of the clientSecret.

### Configure the SCIM Connector Using the Admin UI

- 1. From the navigation bar, click Configure > Connectors.
- 2. On the Connectors page, click New Connector.

The New Connector page displays.

- 3. In the General Details area, from the Connector Type drop-down list, select Scim Connector Version#.
- 4. Enter other details, as necessary, and click Save.

After the connector is properly configured, you can test its status:

```
curl \
 --header "X-OpenIDM-Username: openidm-admin" \
 --header "X-OpenIDM-Password: openidm-admin" \
 --request POST \
 "http://localhost:8080/openidm/system?_action=test"
    "name": "SCIM",
    "enabled": true,
    "config": "config/provisioner.openicf/SCIM",
    "connectorRef": {
      "bundleName": "org.forgerock.openicf.connectors.scim-connector",
      "connectorName": "org.forgerock.openicf.connectors.scim.ScimConnector",
      "bundleVersion": "1.4.0.0"
    "displayName": "Scim Connector",
    "objectTypes": [
        ACCOUNT___",
         ALL__",
GROUP___"
    "ok": true
 }
]
```

A status of "ok": true indicates that the SCIM connector can reach the configured resource provider.

### 15.1. Implementation Specifics

For PATCH requests, a connector can potentially add, remove, or replace an attribute value. The SCIM connector does not implement the add or remove operations, so a PATCH request always replaces the entire attribute value with the new value.

### 15.2. OpenICF Interfaces Implemented by the Scim Connector

The Scim Connector implements the following OpenICF interfaces.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### Schema

Describes the object types, operations, and options that the connector supports.

### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

- The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.
- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

#### **Update**

Updates (modifies or replaces) objects on a target resource.

### 15.3. Scim Connector Configuration

The Scim Connector has the following configurable properties.

### 15.3.1. Basic Configuration Properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
SCIMEndpoint	String	null		Yes	
The HTTP URL defining the root for the SCIM endpoint (https://myserver.com/service/scim)					
SCIMVersion	Integer	1		Yes	
Defines the SCIM protocol version. Values can be either 1 or 2. Default is 1					

Property	Type	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
authenticationMethod	String	OAUTH		Yes
Defines which method is to be upassword), OAUTH (Client id/se	used to authenticate or ecret) or TOKEN (stati	n the remote ser c token). Defaul	ver. Options are BAS ts to OAUTH	SIC (username/
user	String	null		Yes
In case of BASIC authentication	type, this property de	efines the remot	e user.	
password	GuardedString	null	Yes	No
In case of BASIC authentication	type, this property de	efines the remot	e password.	
tokenEndpoint	String	null		No
When using OAUTH, this proper (https://myserver.com/oauth2/to		nt where a new	access token should	be queried for
clientId	String	null		Yes
The client identifier				
clientSecret	GuardedString	null	Yes	No
Secure client secret for OAUTH				
authToken	GuardedString	null	Yes	No
Some service providers (Slack f	or instance) use static	authentication	tokens.	
acceptSelfSignedCertificates	boolean	false		Yes
To be used for debug/test purpo	oses. To be avoided in	production. Defa	aults to false	
disableHostNameVerifier	boolean	false		Yes
To be used for debug/test purpo	oses. To be avoided in	production. Def	aults to false	
clientCertAlias	String	null		Yes
If TLS Mutual Auth is needed, s	et this to the certificat	te alias from the	keystore.	
clientCertPassword	GuardedString	null	Yes	Yes
If TLS Mutual Auth is needed at password, set this to the client p		e (private key) p	eassword is different	than the keystore
maximumConnections	Integer	10		Yes
Defines the max size of the http	connection pool used	. Defaults to 10.		
httpProxyHost	String	null		Yes

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
httpProxyPort	Integer	null		Yes

Defines the Port if an Htpp proxy is used between the connector and the SCIM service provider. Defaults to null.

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

### Chapter 16

## Adobe Campaign Manager Connector

The Adobe Campaign Manager connector enables you to manage profiles in an Adobe Campaign data store. The connector supports a subset of the OpenICF operations, as listed in "OpenICF Interfaces Implemented by the Adobe Marketing Cloud Connector".

To use this connector, you need an Adobe ID.

### 16.1. Before You Start

The Adobe Campaign Manager connector requires the following libraries:

- JSON 20170516
- JSON Web Token

Before you start, download these libraries and copy them to the /path/to/openidm/lib directory.

You must also configure a new integration on AdobeIO, as shown in the following steps. Note that these steps assume a specific version of the AdobeIO user interface. For information on the current version, see the corresponding Adobe documentation.

1. The integration requires a public certificate and private key that will be used to sign the JWT token.

You can use IDM's generated self-signed certificate and private key to test the connector. In a production environment, use a CA-signed certificate and key.

Export IDM's self-signed certificate as follows:

a. Export the certificate and key from JCEKS to standardized format PKCS #12:

```
$ cd /path/to/openidm/security
$ keytool \
-importkeystore \
-srckeystore keystore.jceks \
-srcstoretype jceks \
-destkeystore keystore.p12 \
-deststoretype PKCS12 \
-srcalias openidm-localhost \
-deststorepass changeit \
-destkeypass changeit
```

b. Export the certificate:

```
$ openssl pkcs12 \
-in keystore.p12 \
-nokeys \
-out cert.pem
```

c. Export unencrypted private key:

```
$ openssl pkcs12 \
  -in keystore.p12 \
  -nodes \
  -nocerts \
  -out key.pem
```

- 2. Log in to https://console.adobe.io/ and select Integrations > New Integration.
- Select Access an API > Continue.
- 4. Under the Experience Cloud item, select Adobe Campaign > Continue, then select New integration > Continue.
- 5. Enter a name for the new integration, for example, IDM-managed, and a short description.
- 6. Drag the public certificate that you exported previously into the Public keys certificates box.
- 7. Select a license, then select Create Integration.
- 8. Select Continue to integration details to obtain the Client Credentials required by the connector.

You will need these details for the connector configuration.

### 16.2. Configuring the Adobe Campaign Manager Connector

Create a connector configuration file for the Adobe Campaign Manager connector and place it in your project's conf/ directory.

IDM bundles a sample configuration file (/path/to/openidm/samples/example-configurations/provisioners/provisioner.openicf-adobe.json) that you can use as a starting point. Alternatively, you can create the configuration by using the Admin UI. Select Configure > Connectors > New Connector and select Adobe Marketing Cloud Connector - 1.5.0.0 as the connector type.

The following example shows an excerpt of the provisioner configuration. Enable the connector (set "enabled": true) then edit at least the configurationProperties to match your Adobe IO setup:

```
"configurationProperties" : {
    "endpoint" : "mc.adobe.io",
    "imsHost" : "ims-nal.adobelogin.com",
    "tenant" : "https://example.adobesandbox.com/",
    "apiKey" : "",
    "techAccId" : "example@techacct.adobe.com",
    "orgId" : "example@AdobeOrg",
    "clientSecret" : "CLIENT_SECRET",
    "privateKey" : "PRIVATE_KEY"
},
```

#### endpoint

The Adobe IO endpoint for Marketing Cloud. mc.adobe.io by default - you should not have to change this value.

#### imsHost

The Adobe Identity Management System (IMS) host. ims-nal.adobelogin.com by default - you should not have to change this value.

#### tenant

Your tenant (organization) name or sandbox host.

#### apiKey

The API key (client ID) assigned to your API client account.

#### techAccId

Your Technical account ID, required to generate the JWT.

#### orgId

Your organization's unique ID, for example 12345@AdobeOrg.

#### clientSecret

The client secret assigned to your API client account.

#### privateKey

The private key used to sign the JWT token, corresponds to the public key certificate that you attached to the integration.

For a list of all the configurable properties, see "Adobe Marketing Cloud Connector Configuration".

When your connector is configured correctly, you can test its status by running the following command:

```
$ curl \
--header "X-OpenIDM-Username: openidm-admin" \
--header "X-OpenIDM-Password: openidm-admin" \
 --request POST \
"http://localhost:8080/openidm/system? action=test"
   "name": "adobe",
    "enabled": true,
    "config": "config/provisioner.openicf/adobe",
    "connectorRef": {
      "bundleName": "org.forgerock.openicf.connectors.adobecm-connector",
      "connectorName": "org.forgerock.openicf.acm.ACMConnector",
      "bundleVersion": "1.5.0.0"
    "displayName": "Adobe Marketing Cloud Connector",
    "objectTypes": [
      "__ALL__",
"account"
    "ok": true
 }
1
```

A status of "ok": true indicates that the connector can reach the configured Adobe integration.

# 16.3. OpenICF Interfaces Implemented by the Adobe Marketing Cloud Connector

The Adobe Marketing Cloud Connector implements the following OpenICF interfaces.

#### Create

Creates an object and its uid.

#### Delete

Deletes an object, referenced by its uid.

#### Schema

Describes the object types, operations, and options that the connector supports.

#### **Script on Connector**

Enables an application to run a script in the context of the connector. Any script that runs on the connector has the following characteristics:

• The script runs in the same execution environment as the connector and has access to all the classes to which the connector has access.

- The script has access to a connector variable that is equivalent to an initialized instance of the connector. At a minimum, the script can access the connector configuration.
- The script has access to any script-arguments passed in by the application.

#### Search

Searches the target resource for all objects that match the specified object class and filter.

#### Test

Tests the connector configuration. Testing a configuration checks all elements of the environment that are referred to by the configuration are available. For example, the connector might make a physical connection to a host that is specified in the configuration to verify that it exists and that the credentials that are specified in the configuration are valid.

This operation might need to connect to a resource, and, as such, might take some time. Do not invoke this operation too often, such as before every provisioning operation. The test operation is not intended to check that the connector is alive (that is, that its physical connection to the resource has not timed out).

You can invoke the test operation before a connector configuration has been validated.

### **Update**

Updates (modifies or replaces) objects on a target resource.

### 16.4. Adobe Marketing Cloud Connector Configuration

The Adobe Marketing Cloud Connector has the following configurable properties.

### 16.4.1. Configuration Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
accessToken	GuardedString	null		No
Description is not available				

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

### 16.4.2. Basic configuration properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>
endpoint	String	mc.adobe.io		Yes

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
The Adobe IO endpoint for Marketing Cloud. mc.adobe.io by default - you should not have to change this.					
imsHost	String	ims-nal .adobelogin.com		Yes	
Adobe Identity Management System (IMS) host. ims-na1.adobelogin.com by default - you should not have to change this.					
tenant	String	null		Yes	
Your tenant (organization) name or sandbox host.					

<sup>&</sup>lt;sup>a</sup> Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

### 16.4.3. Adobe Integration Properties Properties

Property	Туре	Default	Encrypted <sup>a</sup>	Required <sup>b</sup>	
apiKey	GuardedString	null	Yes	Yes	
The API key (client ID) assigned to your API client account					
technicalAccountID	String	null		Yes	
Your Technical account ID, required to generate the JWT					
organizationID	String	null		Yes	
Your organizations unique ID, for example 12345@AdobeOrg					
clientSecret	GuardedString	null	Yes	Yes	
The client secret assigned to your API client account					
privateKey	GuardedString	null	Yes	Yes	
The private key used to sign the JWT token, corresponds to the public key certificate attached to the integration					

 $<sup>^{</sup>m a}$  Indicates whether the property value is considered confidential, and therefore encrypted in OpenIDM.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

<sup>&</sup>lt;sup>b</sup> A list of operations in this column indicates that the property is required for those operations.

## **Appendix A. OpenICF Interfaces**

This chapter describes all of the interfaces supported by the OpenICF framework, along with notes about their implementation. Specific connectors may support only a subset of these interfaces.

### A.1. AttributeNormalizer

Normalize attributes to ensure consistent filtering.

### A.2. Authenticate

Provides simple authentication with two parameters, presumed to be a user name and password. If the connector does not implement the AuthenticateOp interface it can not be used in OpenIDM to provide pass-through authentication.

### A.3. Batch

Execute a series of operations in a single request. If a resource does not support batch operations, the connector will not implement the batch operation interface. The OpenICF framework will still support batched requests but the operations will be executed iteratively through the connector.

### A.4. Connector Event

Subscribe for notification of any specified event on the target resource. This operation can be used in the context of IoT device reports, to receive notification of events such as low battery signals, inactive devices, and so on.

### A.5. Create

Create an object and return its uid.

### A.6. Delete

Delete an object by its uid.

### **A.7.** Get

Get an object by its uid.

### A.8. PoolableConnector

Use pools of target resources.

### A.9. Resolve Username

Resolve an object to its uid based on its username.

### A.10. Schema

Describe supported object types, operations, and options.

### A.11. Script on Connector

Allow script execution on connector.

### A.12. Script On Resource

Allow script execution on the resource.

### A.13. Search

Allow searches for resource objects.

Connectors that implement *only* this interface can only be used for reconciliation operations.

### A.14. Sync

Poll for synchronization events, which are native changes to target objects.

### A.15. Sync Event

Subscribe for notification of synchronization events, which are native changes to target objects.

### A.16. Test

Test the connection configuration, including connecting to the resource.

### A.17. Update

Allows an authorized caller to update (modify or replace) objects on the target resource.

### A.18. Update Attribute Values

Allows an authorized caller to update (modify or replace) attribute values on the target resource. This operation is more advanced than the <a href="UpdateOp">UpdateOp</a> operation, and provides better performance and atomicity semantics.

## **Appendix B. OpenICF Operation Options**

This chapter describes all of the predefined operation options by the OpenICF framework, along with notes about their use. Specific connectors may support only a subset of these options.

### B.1. Scope

An option to use with Search (in conjunction with Container) that specifies how far beneath the specified container to search. Must be one of the following values:

- SCOPE\_OBJECT
- SCOPE\_ONE\_LEVEL
- SCOPE\_SUBTREE

### **B.2.** Container

An option to use with Search that specifies the container under which to perform the search. Must be of type QualifiedUid. Should be implemented for those object classes whose ObjectClassInfo.isContainer() returns true.

### B.3. Run as User

An option to use with Script on Resource and possibly others that specifies an account under which to execute the script/operation. The specified account will appear to have performed any action that the script/operation performs.

### B.4. Run with Password

An option to use with Script on Resource and possibly others that specifies a password under which to execute the script/operation.

### B.5. Attributes to Get

Determines which attributes to retrieve during Search and Sync. This option overrides the default behavior, which is for the connector to return exactly the set of attributes that are identified as returned by default in the schema for that connector. This option allows a client application to request additional attributes that would not otherwise not be returned (generally because such attributes are more expensive for a connector to fetch and to format) and/or to request only a subset of the attributes that would normally be returned.

### B.6. Paged Results Cookie

An option to use with Search that specifies an opaque cookie which is used by the connector to track its position in the set of query results.

### B.7. Paged Results Offset

An option to use with Search that specifies the index within the result set of the first result which should be returned.

### B.8. Page Size

An option to use with Search that specifies the requested page results page size.

### B.9. Sort Keys

An option to use with Search that specifies the sort keys which should be used for ordering the ConnectorObject returned by search request.

### B.10. Fail on Error

This option is used with the Batch operation, to specify whether the batch process should be aborted when the first error is encountered. The default behavior is to continue processing regardless of errors.

## B.11. Require Serial

This option instructs the connector to execute batched requests in a serial manner if possible. The default behavior of the Batch operation is to execute requests in parallel, for speed and efficiency. In either case the task ID must be reflected in the response for each task, so that tasks can be correctly reordered.

# Appendix C. Connection Pooling Configuration

Certain connectors support the ability to be pooled. For a pooled connector, OpenICF maintains a pool of connector instances and reuses these instances for multiple provisioning and reconciliation operations. When an operation must be executed, an existing connector instance is taken from the connector pool. If no connector instance exists, a new instance is initialized. When the operation has been executed, the connector instance is released back into the connector pool, ready to be used for a subsequent operation.

For an unpooled connector, a new connector instance is initialized for every operation. When the operation has been executed, OpenICF disposes of the connector instance.

Because the initialization of a connector is an expensive operation, reducing the number of connector initializations can substantially improve performance.

To configure connection pooling, set the following values in the connector configuration file poolConfigOptions property:

- "max0bjects" the maximum number of connector instances in the pool (both idle and active). The default value is 10 instances.
- "maxIdle" the maximum number of idle connector instances in the pool. The default value is 10 idle instances.
- "maxWait" the maximum period to wait for a free connector instance to become available before failing. The default period is 150000 milliseconds, or 15 seconds.
- "minEvictableIdleTimeMillis" the minimum period to wait before evicting an idle connector instance from the pool. The default period is 120000 milliseconds, or 12 seconds.

• "minIdle" - the minimatance.	nimum number of idle	connector instance	s in the pool. The de	efault value is 1
